## DIVISIONS 41 THROUGH 49—NOT USED

## VOLUME 3

**DRAWINGS**

**END OF SECTION**
PART 1 GENERAL

1.01 RELATED SECTIONS

A. Requirements specified within this section apply to Division 26, Electrical. Work specified herein shall be performed as if specified in the individual sections.

1.02 REFERENCES

A. The following is a list of standards which may be referenced in this section:

4. UL.

1.03 SUMMARY OF WORK

A. The Contractor shall furnish and install all materials, equipment and supplies as shown on Drawings and described in these Specifications, and as may otherwise be required to provide a complete and functional electrical system for the multiple areas of development.

B. The Contractor shall coordinate with the Supplying Electric Utility for new underground electric service(s) at all locations as shown on Drawings. Refer to Article Electric Service Division of Responsibility.

C. The Contractor shall provide for the trench excavation, water pumping and draining, supply of clean fill, backfilling, consolidation and compaction required for all underground electrical work.

D. The Contractor shall apply the appropriate relay settings as furnished under Section 26 05 70, Electrical Systems Analysis, and shall provide a complete checkout and testing of the installed system prior to energization per Section 26 08 00, Commissioning of Electrical Systems. Contractor shall provide Arc-Flash Hazard labeling for all electrical distribution and control equipment as described in Section 26 05 70, Electrical Systems Analysis.
E. The Contractor shall provide for the temporary power requirements of all disciplines as needed for the construction of the new facilities, and the temporary powering of the existing dam gate operators. The Contractor shall coordinate these needs directly with the Owner.

1.04 GENERAL REQUIREMENTS

A. Specifications and Drawings shall be considered as supplementary to each other, requiring materials and labor indicated, specified, or implied. Contradictions noted by the Contractor shall be presented to the Owner’s Engineer for resolution.

B. NFPA 70, National Electrical Code (NEC) shall establish the minimum requirements for the installation. Where Drawings and/or Specifications provide a more rigid requirement for the installation, then Drawings and/or Specifications shall prevail.

C. Interpretation of the Specifications or Drawings, if deemed necessary by the Contractor, shall be made only by the Owner’s Engineer.

D. These electrical specifications shall be considered prescriptive, meaning that there are specific manufacturer products called out and required for the work, and set the basis of design and material’s acceptance for installation. It is the Contractor’s responsibility to read, understand and procure the material items identified in these electrical specifications to meet these standards. Failure by the Contractor to procure and install manufactured materials identified on Drawings and Specifications will be cause for rejection of the work.

1.05 DEFINITIONS

A. Provide: To both furnish and install.

B. Standard Supplier: The party under contract for furnishing the products covered by this Work.

C. Contractor/Subcontractor/Installing Contractor: The party under contract to install the products furnished for this Work.

D. For the purposes of this Project, the Standard Supplier and the Contractor/Subcontractor/Installing Contractor shall be the same party.
1.06 COORDINATION

A. The Contractor performing the work is henceforth referred to be the Installing Contractor, Contractor, Standard Supplier or Electrical Subcontractor.

B. Other work that is either directly, or indirectly, related to the scheduled performance of work under these Drawings and Specifications is anticipated to be performed by others.

C. Coordinate the work of these Drawings and Specifications with the work of others.

D. Include sequencing constraints specified as part of the progress schedule.

E. Reference Drawings and Specifications for limits of work provided by others.

F. Refer to coordination requirements with the Supplying Electric Utility as described in Article Electric Service Division of Responsibility.

1.07 ELECTRIC SERVICE DIVISION OF RESPONSIBILITY

A. Multiple points of Service Delivery may be required by this Project on both the East and West Banks. Incoming overhead and underground electric service facilities provided by the Supplying Electric Utility (as part of its service arrangement with the Owner) is work provided outside this Contract. Under this Contract, the Contractor shall initiate all service request(s) under its name for later transfer to the Owner, and coordinate service delivery with the Supplying Electric Utility. Under this Contract, the Contractor shall provide customer required service provisions and electrical work including, but not limited to, primary service conduits, transformer pad and site preparation, transformer pad, installation of metering components and associated conduit, and all secondary facilities and conductors.

1.08 SEISMIC DESIGN REQUIREMENTS

A. Where required for the support of all installed electrical equipment to meet the seismic requirements as stated in Section 01 88 15, Anchorage and Bracing, provide anchorage and bracing design drawings, calculations, seismic certification, and related information, signed/sealed by a Structural Engineer in the State of Oklahoma.

B. Refer to Submittal requirements in Article Submittals.
1.09 SUBMITTALS

A. Review, acceptance, or approval of substitutions, schedules, Shop Drawings, list of materials and procedures submitted or requested by the Standard Supplier shall not add to the contract amount, and additional costs which may result shall solely be the obligation of the Standard Supplier.

B. The Owner is not precluded, by virtue of review, acceptance or approval from obtaining a credit for savings resulting from allowed concessions in the work or materials, or from the reduction in quantities of components.

C. All approved documents shall be submitted to the Owner in the “Native Form” so that the Owner will have the ability to edit them as needed. Refer to the Section 01 33 00, Submittal Procedures, for procedures and requirements concerning Shop Drawing submittals.

D. The Owner’s and/or Owner’s Engineer’s review and approval of Contractor Submittals does not relieve the Contractor of the responsibility of assuring full compliance with Drawings and Specifications. Contractor shall be fully responsible that all equipment, material and installations meet the full intent of these Drawings and Specifications regardless of submittal reviews.

E. Shop Drawings:

1. Shall be defined as Drawings, diagrams, illustrations, schedules and other data which are specifically prepared by/for the Standard Supplier to illustrate the work to be done or the material/equipment to be provided.
2. Refer to the Section 01 33 00, Submittal Procedures, for procedures and requirements concerning Shop Drawings.

F. Quality Control Submittals:

1. Furnish manufacturer’s certification of proper installation stating system/equipment has been installed in accordance with manufacturer’s recommendations and has been inspected by a manufacturer’s authorized representative.
2. Functional test certificate shall be required from the manufacturer monitoring the test and certifying in writing that the equipment tested is both functional and ready for continuous operation.
3. Refer to Section 01 33 00, Submittal Procedures, for procedures and requirements concerning quality control submittals.
G. Operation and Maintenance Data:

1. Furnish for each system, or item of equipment, as necessary for the Owner to properly operate and maintain the equipment in accordance with the manufacturer’s recommendations.

2. Refer to Section 01 33 00, Submittal Procedures, for procedures and requirements concerning operation and maintenance data.

1.10 PRODUCT SHIPMENT, HANDLING, STORAGE, AND PROTECTION

A. Standard Supplier shall provide Owner’s representative on site notice of shipment of at least 7 days prior to shipment.

B. All products, where practical, shall be fully factory assembled.

C. Package or crate products to provide protection from damage during shipment, handling and storage.

D. Mark spare parts and special tools to identify the associated products by name, equipment, and part number.

E. The Contractor shall be responsible for receiving, inspecting and documenting the delivered condition of all materials, and its subsequent offloading, transporting and storage at the jobsite.

1.11 MANUFACTURER’S SERVICES

A. As required and shown on Drawings and as described elsewhere in these Specifications.

1.12 QUALITY ASSURANCE

A. Provide the Work in accordance with the NEC. Where required by the Authority Having Jurisdiction (AHJ), material and equipment shall be labeled or listed by a nationally recognized testing laboratory (NRTL) or other organization acceptable to the AHJ, in order to provide a basis for approval under the NEC.

B. Materials and equipment manufactured within the scope of standards published by UL shall conform to those standards and shall have an applied NRTL listing mark or label.
1.13 ENVIRONMENTAL CONDITIONS

A. General: Use appropriate materials and methods for each area as specified below.

B. The following areas are classified nonhazardous and wet:
   1. Outdoor above grade areas.
   2. Outdoor below grade areas unless noted elsewhere in this Article.

C. The following areas are classified as nonhazardous and damp:
   1. Indoors, Compressor Building’s PSO Pump Room.

D. The following areas are classified as nonhazardous and dry:
   1. Indoors, Compressor Building’s Air Compressor Room.
   2. Indoors, Compressor Building’s Electrical Room.

E. The following areas are classified as hazardous and wet:
   1. Outdoors, Hydraulic Pump Vault (Class I, Division 2, Group D).

PART 2 PRODUCTS

2.01 GENERAL

A. Where two or more units of the same class of material or equipment are required, provide products of a single manufacturer. Component parts of materials or equipment need not be products of the same manufacturer.

B. Material and equipment installed in heated and ventilated areas shall be capable of continuous operation at their specified ratings within an ambient temperature range of 40 degrees F to 104 degrees F, inclusively.

C. Materials and equipment installed outdoors shall be capable of continuous operation at their specified rating within the ambient temperature range of 0 degrees F to 104 degrees F, inclusively.

2.02 EQUIPMENT FINISH

A. Manufacturer’s standard finish color, except where specific color is indicated on Drawings or in these Specifications. If manufacturer has no standard color, finish equipment with color ANSI No. 61; Sky Blue Grey.
2.03 NAMEPLATES

A. Material: Laminated plastic.

B. Attachment Screws: Stainless steel.

C. Color: White, engraved to a black core, unless specified differently elsewhere on Drawings or in these Specifications.

D. Letter Height:
   2. Other Electrical Equipment: 1/4-inch.

2.04 SIGNS AND LABELS

A. Sign size, lettering, and color shall be in accordance with NEMA Z535.4.

PART 3 EXECUTION

3.01 GENERAL

A. Electrical Drawings show general locations of equipment, devices, and raceway, unless specifically dimensioned. Contractor shall be responsible for actual location of equipment and devices and for proper routing and support of raceways, subject to approval of Engineer.

B. Check approximate locations of luminaire, wiring devices, equipment, and other electrical system components shown on Drawings for conflicts with openings, structural members, and components of other systems and equipment having fixed locations. In the event of conflicts, notify Engineer in writing.

C. Install work in accordance with NECA Standard of Installation, unless otherwise specified.

D. Keep openings in boxes and equipment closed during construction.

E. Lay out work carefully in advance. Do not cut or notch any structural member or building surface without specific approval of Engineer. Carefully perform cutting, channeling, chasing, or drilling of floors, walls, partitions, ceilings, paving, or other surfaces required for the installation, support, or anchorage of conduit, raceways, or other electrical materials and equipment. Following such work, restore surfaces to original condition.
3.02 ANCHORING, BRACING, AND MOUNTING

A. Equipment anchoring and mounting shall be in accordance with manufacturer’s requirements for USGA/FEMA Seismic Design Criteria as specified in Section 01 88 15, Anchorage and Bracing.

3.03 COMBINING CIRCUITS INTO COMMON RACEWAY

A. Drawings show each homerun circuit to be provided. Do not combine homeruns, feeders or branch circuits into common raceways unless specifically indicated on Drawings, or as described in Paragraph B below.

B. Homerun circuits shown on Drawings indicate functional wiring requirements for power and control circuits. Circuits may only be combined into common raceways in accordance with the following requirements:

1. Analog control circuits from devices in the same general area to same destination.
   a. No power or ac discrete control circuits shall be combined in same conduit with analog circuits.
   b. No Class 2 or Class 3 circuits including, but not limited to, HVAC control circuits, fire alarm circuits, paging system circuits shall be combined with power or Class 1 circuits.
   c. Analog circuits shall be continuous from source to destination. Do not add TJB, splice, or combine into a multi-pair cable unless specifically indicated on Drawings.
   d. Raceways shall be sized per General Circuit and Raceway Schedule.
   e. All deviations from Drawings shall be documented on Record Drawings.

2. Discrete control circuits from devices in the same general area to the same destination.
   a. No power or analog control circuits shall be combined in same conduit with discrete circuits.
   b. No Class 2 or Class 3 circuits including, but not limited to, HVAC control circuits, fire alarm circuits, and paging system circuits shall be combined with power or Class 1 circuits.
   c. Raceways shall be sized per the General Circuit and Raceway Schedule.
   d. All deviations from Drawings shall be documented on record drawings.

3. Power circuits from loads in same general area to same source location (such as: panelboard, switchboard, low voltage motor control center).
   a. Lighting Circuits: Shall have dedicated conduit runs and neutral conductors unless specifically indicated otherwise on Drawings.
b. Receptacle Circuits (120V ac): Shall have dedicated conduit runs and neutral conductors unless specifically indicated otherwise on Drawings.

c. All Other Power Circuits: Shall have dedicated conduit runs and neutral conductors. No exceptions.

3.04 NAMEPLATES, SIGNS, AND LABELS

A. Arc Flash Protection Warning Signs:

1. Field mark switchboards, motor control centers, panelboards, control panels, and disconnect switches to warn qualified persons of potential arc-flash hazards. Locate marking so to be clearly visible to persons before working on energized equipment.

2. Use arc flash hazard boundary, energy level, PPE level and description, shock hazard, bolted fault current, and equipment name from required study in Section 26 05 70, Electrical Systems Analysis.

B. Available Fault Current Signs:

1. Install label on service equipment to indicate the maximum available fault current at the equipment. Labels shall be of sufficient durability for the environment in which the equipment is installed. Labels shall include the following information:
   a. Equipment name or identification.
   b. Available fault current at the equipment.
   c. Date the fault current calculations were performed.

2. Use bolted fault current and equipment name from study required in Section 26 05 70, Electrical Systems Analysis, as basis for the label.

3. Where existing electrical systems are modified, completely remove existing fault current labels if present, and install new labels in accordance with the above requirements.

C. Equipment Nameplates:

1. Provide a nameplate to label electrical equipment including switchgear, switchboards, motor control centers, panelboards, motor starters, transformers, terminal junction boxes, disconnect switches, switches and control stations.

2. Switchgear, motor control center, transformer, and terminal junction box nameplates shall include equipment designation.

3. Disconnect switch, starter, and control station nameplates shall include name and number of equipment powered or controlled by that device.

4. Switchboard and panelboard nameplates shall include equipment designation, service voltage, and phases.
D. Procedural Signs: Provide a procedural sign on service-entrance equipment indicating key interlock and transfer procedure from utility to standby generator connection.

3.05 LOAD BALANCE

A. Drawings and Specifications indicate circuiting to electrical loads and distribution equipment.

B. Contractor shall balance electrical load between phases as nearly as possible on switchboards, panelboards, motor control centers, and other equipment where balancing is required.

C. When loads must be reconnected to different circuits to balance phase loads, Contractor shall maintain accurate record of changes made, and provide circuit directory that lists final circuit arrangement.

3.06 CLEANING AND TOUCHUP PAINTING

A. Cleaning: Throughout the Work, clean interior and exterior of devices and equipment by removing debris and vacuuming.

B. Touchup Paint:

1. Touchup scratches, scrapes and chips on exterior and interior surfaces of devices and equipment with finish matching type, color, and consistency and type of surface of original finish.

2. If extensive damage is done to equipment paint surfaces, refinish entire equipment in a manner that provides a finish equal to or better than factory finish, that meets requirements of Specification, and is acceptable to Engineer.

3.07 PROTECTION FOLLOWING INSTALLATION

A. Protect materials and equipment from corrosion, physical damage, and effects of moisture on insulation and contact surfaces.

B. When equipment intended for indoor installation is installed at Contractor’s convenience in areas where subject to dampness, moisture, dirt or other adverse atmosphere until completion of construction, ensure adequate protection from these atmospheres is provided and acceptable to Engineer.

END OF SECTION
PART 1    GENERAL

1.01    REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   b. E814, Method of Fire Tests of Through-Penetration Fire Stops.

2. Canadian Standards Association (CSA).

5. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
   c. C12.6, Phase-Shifting Devices Used in Metering, Marking and Arrangement of Terminals.
   d. ICS 2, Industrial Control and Systems: Controllers, Contactors, and Overload Relays Rated 600 Volts.
   e. ICS 5, Industrial Control and Systems: Control Circuit and Pilot Devices.
   f. KS 1, Enclosed and Miscellaneous Distribution Switches (600 Volts Maximum).

7. UL:
   a. 98, Standard for Enclosed and Dead-Front Switches.
   b. 248, Standard for Low Voltage Fuses.
   c. 486E, Standard for Equipment Wiring Terminals for use with Aluminum and/or Copper Conductors.
   d. 489, Standard for Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures.
   e. 508, Standard for Industrial Control Equipment.
   f. 810, Standard for Capacitors.
   g. 943, Standard for Ground-Fault Circuit-Interrupters.
1.02 SUBMITTALS

A. Action Submittals:

1. Provide manufacturers’ data for the following:
   a. Control devices.
   b. Control relays.
   c. Circuit breakers.
   d. Fused switches.
   e. Nonfused switches.
   f. Timers.
   g. Fuses.
   h. Magnetic contactors.
   i. Intrinsic safety barriers.
   j. Firestopping.
   k. Enclosures: Include enclosure data for products having enclosures.

2. Seismic anchorage and bracing drawings and cut sheets, as required by Section 26 05 02, Basic Electrical Requirements.

B. Informational Submittals: Seismic anchorage and bracing calculations as required by Section 26 05 02, Basic Electrical Requirements.

1.03 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following spare parts and special tools:

1. Fuses, 0 Volt to 600 Volts: Six of each type and each current rating installed.

2. Indicator Lamps, LED: Two of each type.

PART 2 PRODUCTS

2.01 MOLDED CASE CIRCUIT BREAKER THERMAL MAGNETIC, LOW VOLTAGE

A. General:

1. Type: Molded case.
2. Trip Ratings: 15 amps to 800 amps.
3. Voltage Ratings: 120, 240, 277, 480, and 600V ac.
4. Suitable for mounting and operating in any position.
5. UL 489.

B. Operating Mechanism:

1. Overcenter, trip-free, toggle type handle.
2. Quick-make, quick-break action.
3. Locking provisions for padlocking breaker in OPEN position.
4. ON/OFF and TRIPPED indicating positions of operating handle.
5. Operating handle to assume a CENTER position when tripped.

C. Trip Mechanism:

1. Individual permanent thermal and magnetic trip elements in each pole.
2. Variable magnetic trip elements with a single continuous adjustment 3X to 10X for frames greater than 100 amps.
3. Two and three pole, common trip.
4. Automatically opens all poles when overcurrent occurs on one pole.
5. Test button on cover.
6. Calibrated for 40 degrees C ambient, unless shown otherwise.
7. Do not provide single-pole circuit breakers with handle ties where multi-pole circuit breakers are shown.
8. Do not furnish three-pole devices for two- or single-pole circuits.

D. Short Circuit Interrupting Ratings: Equal to, or greater than, available fault current or interrupting rating as shown on Drawings.

E. Ground Fault Circuit Interrupter (GFCI):

1. Where indicated, equip circuit breaker with ground fault sensor and rated to trip on 4-mA to 6-mA ground fault within 0.025 second (UL 943, Class A sensitivity, for protection of personnel).
2. Ground fault sensor shall be rated same as circuit breaker.
3. Push-to-test button.

F. Equipment Ground Fault Interrupter (EGFI): Where indicated, equip circuit breaker specified above with ground fault sensor and rated to trip on 30-mA ground fault (UL-listed for equipment ground fault protection).

G. Accessories: Shunt trip, auxiliary switches, handle lock ON devices, mechanical interlocks, key interlocks, unit mounting bases, double lugs as shown or otherwise required. Shunt trip operators shall be continuous duty rated or have coil-clearing contacts.
H. Connections:

1. Supply (line side) at either end.
2. Mechanical wire lugs, except crimp compression lugs where shown.
3. Lugs removable/replaceable for breaker frames greater than 100 amperes.
4. Suitable for 75 degrees C rated conductors without derating breaker or conductor ampacity.
5. Use bolted bus connections, all devices.

I. Enclosures for Independent Mounting:

1. As indicated on Drawings and required elsewhere in these Specifications.
2. Service Entrance Use: Breakers in required enclosure and required accessories shall be UL 489 listed.
3. Interlock: Enclosure and switch shall interlock to prevent opening cover with switch in the ON position. Provide bypass feature for use by qualified personnel.

2.02 FUSED SWITCH, INDIVIDUAL, LOW VOLTAGE

A. UL 98 listed for use and location of installation.

B. NEMA KS 1.

C. Short Circuit Rating: 200,000 amps rms symmetrical with Class R, Class J, or Class L fuses installed.

D. Quick-make, quick-break, motor rated, load-break, heavy-duty (HD) type with external markings clearly indicating ON/OFF positions.

E. Connections:

1. Mechanical lugs, except crimp compression lugs where shown.
2. Lugs removable/replaceable.
3. Suitable for 75 degrees C rated conductors at NEC 75 degrees C ampacity.

F. Fuse Provisions:

1. 30-amp to 600-amp rated shall incorporate rejection feature to reject all fuses except Class R.
2. 601-amp rated and greater shall accept Class L fuses, unless otherwise shown.
G. Enclosures: See Article Enclosures.

H. Interlock: Enclosure and switch to prevent opening cover with switch in ON position. Provide bypass feature for use by qualified personnel.

2.03 NON-FUSED SWITCH, INDIVIDUAL, LOW VOLTAGE

A. NEMA KS 1.

B. Quick-make, quick-break, motor rated, load-break, heavy-duty (HD) type with external markings clearly indicating ON/OFF positions.

C. Lugs: Suitable for use with 75 degrees C wire at NEC 75 degrees C ampacity.

D. Auxiliary Contact:
   1. Operation: Make before power contacts make, and break before power contacts break.
   2. Contact Rating: 7,200VA make, 720VA break, at 600V, NEMA ICS 5 Designation A600.

E. Enclosures: As indicated on Drawings and required elsewhere in these Specifications.

F. Interlock: Enclosure and switch to prevent opening cover with switch in ON position. Provide bypass feature for use by qualified personnel.

2.04 FUSE, 250-VOLT AND 600-VOLT

A. Power Distribution, General:
   1. Current-limiting, with 200,000 ampere rms interrupting rating.
   2. Provide to fit mountings specified with switches.
   3. UL 248.

B. Power Distribution, Ampere Ratings 1 Amp to 600 Amps:
   2. Type: Dual element, with time delay.
   3. Manufacturers and Products:
      a. Bussmann; Types LPS-RK (600 volts) and LPN-RK (250 volts).
      b. Littelfuse; Types LLS-RK (600 volts) and LLN-RK (250 volts).

C. Power Distribution, Ampere Ratings 601 Amps to 6,000 Amps:
   1. Class: L.
   2. Double O-rings and silver links.
3. Manufacturers and Products:
   a. Bussmann; Type KRP-C.
   b. Littelfuse, Inc.; Type KLPC.

D. Ferrule:
   1. 600V or less, rated for applied voltage, small dimension.
   2. Ampere Ratings: 1/10 amp to 30 amps.
   3. Dual-element time-delay, time-delay, or nontime-delay as required.
   4. Provide with blocks or holders as indicated and suitable for location and use.
   5. Manufacturers:
      a. Bussmann.
      b. Littlefuse, Inc.

2.05 PUSHBUTTON, INDICATING LIGHT, AND SELECTOR SWITCH

A. Contact Rating: 7,200VA make, 720VA break, at 600V, NEMA ICS 5 Designation A600.

B. Selector Switch Operating Lever: Standard.

C. Indicating Light: LED, full voltage, Push-to-Test.

D. Pushbutton Color:
   1. ON or START: Green.
   2. OFF or STOP: Red.

E. Pushbutton and selector switch lockable in OFF position where indicated.

F. Legend Plate:
   1. Material: Aluminum.
   2. Engraving: Enamel filled in high contrasting color.
   3. Text Arrangement: 11-character/spaces on one line, 14-character/spaces on each of two lines, as required, indicating specific function.
   4. Letter Height: 7/64 inch.

G. Manufacturers and Products:
   1. Heavy-Duty, Oil-Tight Type:
      a. General Electric Co.; Type CR 104P.
      b. Square D Co.; Type T.
      c. Eaton/Cutler-Hammer; Type 10250T.
2. Heavy-Duty, Watertight, and Corrosion-Resistant Type:
   a. Square D Co.; Type SK.
   b. General Electric Co.; Type CR 104P.
   c. Eaton/Cutler-Hammer; Type E34.
   d. Crouse-Hinds; Type NCS.

2.06 TERMINAL BLOCK, 600 VOLTS

   A. UL 486E and UL 1059.
   B. Size components to allow insertion of necessary wire sizes.
   C. Capable of termination of control circuits entering or leaving equipment, panels, or boxes.
   D. Screw clamp compression, dead front barrier type, with current bar providing direct contact with wire between compression screw and yoke.
   E. Yoke, current bar, and clamping screw of high strength and high conductivity metal.
   F. Yoke shall guide all strands of wire into terminal.
   G. Current bar shall ensure vibration-proof connection.
   H. Terminals:
      1. Capable of wire connections without special preparation other than stripping.
      2. Capable of jumper installation with no loss of terminal or rail space.
      3. Individual, rail mounted.
   I. Marking system, allowing use of preprinted or field-marked tags.
   J. Manufacturers:
      1. Weidmuller, Inc.
      2. Ideal.
      3. Electrovert USA Corp.

2.07 MAGNETIC CONTROL RELAY

   A. Industrial control with field convertible contacts rated 10 amps continuous, 7,200VA make, 720VA break.
   B. NEMA ICS 2, Designation: A600 (600 volts).
C. Time Delay Relay Attachment:
   1. Pneumatic type, timer adjustable from 0.2 second to 60 seconds (minimum), or as indicated on Drawings.
   2. Field convertible from ON delay to OFF delay and vice versa.

D. Latching Attachment: Mechanical latch, having unlatching coil and coil clearing contacts.

E. Manufacturers and Products:
   1. Eaton/Cutler-Hammer; D26 Type M.
   2. General Electric Co.; Type CR120B.
   3. Square D; Type X.

2.08 TIME DELAY RELAY

A. Industrial relay with contacts rated 5 amps continuous, 3,600VA make, 360VA break.

B. NEMA ICS 2 Designation: B150 (150 volts).

C. Solid-state electronic, field convertible ON/OFF delay.

D. One normally open and one normally closed contact (minimum).

E. Repeat accuracy plus or minus 2 percent.

F. Timer adjustment from 1 second to 60 seconds, unless otherwise indicated on Drawings.

G. Manufacturers and Products:
   1. Square D Co.; Type XO.
   2. Eaton/Cutler-Hammer; Type D26MR.
   3. General Electric Co.; Type CR120.

2.09 RESET TIMER

A. Drive: Synchronous motor, solenoid-operated clutch.

B. Mounting: Semiflush panel.

C. Contacts: 10 amps, 120 volts.
D. Manufacturers and Products:
   1. Eagle Signal Controls; Bulletin 125.

2.10 ELAPSED TIME METER
A. Drive: Synchronous motor.
B. Range: 0 hour to 99,999.9 hours, nonreset type.
C. Mounting: Semiflush panel.
D. Manufacturers and Products:
   1. General Electric Co.; Type 240, 2-1/2-inch Big Look.
   2. Eagle Signal Controls; Bulletin 705.

2.11 MAGNETIC CONTACTOR
A. UL listed.
B. Electrically operated, electrically held.
C. Main Contacts:
   1. Power driven in one direction with mechanical spring dropout.
   2. Silver alloy with wiping action and arc quenchers.
   3. Continuous-duty, rated 30 amperes, or as shown on Drawings.
   4. Poles: Three, or as shown on Drawings.
D. Control: Two-wire.
E. Auxiliary Contacts: Quantity as shown on Drawings, rated 7200VA make, 720VA break, at 600V, A600 per NEMA ICS 5.
F. Enclosures: As indicated on Drawings and required elsewhere in these Specifications.
G. Manufacturers and Products:
   1. Eaton/Cutler-Hammer; Class A201.
   3. Square D Co.; Class 8910.
2.12 PHASE MONITOR RELAY

A. Features:

1. Voltage and phase monitor relay shall drop out on low voltage, voltage unbalance, loss of phase, or phase reversal.
2. Contacts: Single-pole, double-throw, 10 amperes, 120/240V ac. Where additional contacts are shown or required, provide magnetic control relays.
3. Adjustable trip and time delay settings.
4. Transient Protection: 1,000V ac.

B. Manufacturer and Product: Automatic Timing and Controls; SLD Series.

2.13 MAGNETIC LIGHTING CONTACTOR

A. Comply with NEMA ICS 2; provide UL 508 listing.

B. Electrically operated by dual-acting, single coil mechanism.

C. Inherently interlocked and electrically held in the CLOSED position.

D. Main Contacts:

1. Double-break, continuous-duty, rated 30 amperes, 600 volts, withstand rating of both 22,000 amps rms symmetrical at 250 volts, and 14,000 amps rms symmetrical at 480 volts.
2. Marked for LED, electric discharge lamps, tungsten, and general purpose loads.
3. Position not dependent on gravity, hooks, latches, or semipermanent magnets.
4. Capable of operating in any position.
5. Visual indication for each contact.

E. Auxiliary contact relay for two-wire control.

F. One normally open and one normally closed auxiliary contact rated 10 amperes continuous, 7,200VA make, 720VA break with NEMA designation of A600 (600 volts).

G. Fully rated neutral terminal.

H. Provision for remote pilot lamp with use of auxiliary contacts.

I. Clamp type, self-rising terminal plates for solderless connections.
J. Enclosures: See Article Enclosures.

K. Manufacturers and Products:
   1. ASCO.
   3. General Electric Co.; Class 360 (electrically held).
   4. Square D; Class 8903, Type L (electrically held).

2.14 SUPPORT AND FRAMING CHANNELS

A. Carbon Steel Framing Channel:
   1. Material: Rolled, mild strip steel, 12-gauge minimum, ASTM A1011/A1011M, Grade 33.

B. Paint Coated Framing Channel: Carbon steel framing channel with electrodeposited rust inhibiting acrylic or epoxy paint.

C. PVC-Coated Framing Channel: Carbon steel framing channel with 40-mil polyvinyl chloride coating.

D. Stainless Steel Framing Channel: Rolled, Type 316 stainless steel, 12-gauge minimum.

E. Extruded Aluminum Framing Channel:
   1. Material: Extruded from Type 6063-T6 aluminum alloy.
   2. Fittings fabricated from Alloy 5052-H32.

F. Nonmetallic Framing Channel:
   2. Channel fitting of same material as channel.

G. Manufacturers:
   1. B-Line Systems, Inc.
   2. Unistrut Corp.
   3. Aickinstrut.
2.15 SWITCHBOARD MATTING

A. Provide matting having a breakdown of 20 kV minimum.

B. Manufacturer: U.S. Mat and Rubber Company.

2.16 FIRESTOPS

A. General:

1. Provide UL 1479 classified hourly fire rating equal to, or greater than, the assembly penetrated.
2. Prevent the passage of cold smoke, toxic fumes, and water before and after exposure to flame.
3. Sealants and accessories shall have fire-resistance ratings as established by testing identical assemblies in accordance with ASTM E814, by UL, or other testing and inspection agency acceptable to authorities having jurisdiction.

B. Firestop System:

1. Formulated for use in through-penetration firestopping around cables, conduit, pipes, and duct penetrations through fire-rated walls and floors.
3. Two-Part, Foamed-In-Place, Silicone Sealant: Dow Corning Corp. Fire Stop Foam, General Electric Co. Pensil 851.
4. Fire Stop Devices: See Section 26 05 33, Raceway and Boxes, for raceway and cable fittings.

2.17 ENCLOSURES

A. Finish: Aluminum, and Type 304 stainless steel, structural and enclosure parts shall be completely painted using an electrodeposition process so interior and exterior surfaces, as well as bolted structural joints, have a complete finish coat on and between them.

B. Color: Manufacturer’s standard color (ANSI No. 61, Sky Blue Grey) baked-on enamel, unless otherwise indicated on Drawings or elsewhere in these Specifications.

C. Barriers: Provide nonmetallic barriers within enclosures to separate wiring of different systems and voltage.
D. Enclosure Selections:

1. Except as indicated otherwise on Drawings or in these Specifications, provide electrical enclosures according to the following table:

<table>
<thead>
<tr>
<th>Enclosures</th>
<th>Location</th>
<th>Finish</th>
<th>Environment</th>
<th>NEMA 250 Type</th>

PART 3 EXECUTION

3.01 GENERAL
   A. Install equipment in accordance with manufacturer’s recommendations.

3.02 PUSHBUTTON, INDICATING LIGHT, AND SELECTOR SWITCH
   A. Install heavy-duty, oil-tight type in nonhazardous, indoor, dry locations, including motor control centers, control panels, and individual stations, unless otherwise shown.
   B. Install heavy-duty, watertight and corrosion-resistant type in nonhazardous, outdoor, or normally wet areas, unless otherwise shown.

3.03 SUPPORT AND FRAMING CHANNEL
   A. Install where required for mounting and supporting electrical equipment, raceway, and cable tray systems.
   B. Channel Type:
      1. Interior, Wet or Dry (Noncorrosive) Locations:
         a. Aluminum Raceway: Aluminum framing channel, and Type 304 stainless steel hardware.
         b. Steel Raceway and Other Systems Not Covered: Type 304 stainless steel framing channel and hardware.
      2. Outdoor, Noncorrosive Locations:
         a. Steel Raceway: Type 304 stainless steel framing channel and hardware.
b. Aluminum Raceway and Other Systems Not Covered: Aluminum framing channel and Type 304 stainless steel hardware.

3. Aluminum Railings: Devices mounted on aluminum railing shall use aluminum framing channel.

C. Paint cut ends prior to installation with the following:

1. Carbon Steel Channel: Zinc-rich primer.
2. Painted Channel: Rust-inhibiting epoxy or acrylic paint.
4. PVC-Coated Channel: PVC patch.

3.04 SWITCHBOARD MATTING

A. Install 36-inch width at switchgear, switchboard, motor control centers, and panelboards.

B. Matting shall run full length of all sides of equipment that have operator controls or afford access to devices.

C. Provide in front of all electrical panels in buildings, rooms, and other walk-in style enclosures.

3.05 FIRESTOPS

A. Install in strict conformance with manufacturer’s instructions. Comply with installation requirements established by testing and inspecting agency.

B. Sealant: Install sealant including forming, packing, and other accessory materials, to fill openings around electrical services penetrating floors and walls, to provide firestops with fire-resistance ratings indicated for floor or wall assembly in which penetration occurs.

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):

2. Institute of Electrical and Electronics Engineers, Inc. (IEEE): 386, Standard for Separable Insulated Connector Systems for Power Distribution Systems Above 600V.

3. Insulated Cable Engineer’s Association, Inc. (ICEA):
   c. T-29-520, Conducting Vertical Cable Tray Flame Tests with Theoretical Heat Input of 210,000 Btu/hour.

4. National Electrical Manufacturers’ Association (NEMA):
   a. CC 1, Electric Power Connectors for Substations.
   b. WC 57, Standard for Control, Thermocouple Extension, and Instrumentation Cables.
   e. WC 74, 5-46 kV Shielded Power Cable for Use in the Transmission and Distribution of Electric Energy.

5. National Fire Protection Association (NFPA):
   a. 70, National Electrical Code (NEC).
   b. 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

7. UL:
   e. 486C, Standard for Safety for Splicing Wire Connectors.
   f. 510, Standard for Safety for Polyvinyl Chloride, Polyethylene, and Rubber Insulating Tape.
   g. 854, Standard for Safety for Service-Entrance Cables.
   h. 1277, Standard for Safety for Electrical Power and Control Tray Cables with Optional Optical-Fiber Members.
   i. 1569, Standard for Safety for Metal-Clad Cables.

1.02 SUBMITTALS

A. Action Submittals:

1. Product Data:
   a. Wire and cable.
   b. Wire and cable accessories.

2. Cable Pulling Calculations:
   a. Ensure submitted and reviewed before cable installation.
   b. Provide for the following cable installations:
      1) Multi-conductor 600-volt cable sizes larger than 2 AWG that cannot be hand pulled.
      2) Feeder circuits; single conductor No. 4/0 and larger.
      3) Dam gate instrumentation cables.
      4) Flume gate instrumentation cables.

B. Informational Submittals: Certified Factory Test Report for conductors 600 volts and below.

1.03 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

1. Provide the Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, material and equipment shall be labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ in order to provide a basis for approval under NEC.
2. Materials and equipment manufactured within the scope of standards published by UL shall conform to those standards and shall have an applied NRTL listing or labeling mark.

PART 2 PRODUCTS

2.01 CONDUCTORS 600 VOLTS AND BELOW

A. Conform to applicable requirements of NEMA WC 70.

B. Conductor Type:

1. 120-Volt and 277-Volt Lighting, 10 AWG and Smaller: Solid copper.
2. 120-Volt Receptacle Circuits, 10 AWG and Smaller: Solid copper.
3. All Other Circuits: Stranded copper.

C. Insulation: Type XHHW-2 insulation.

D. Direct Burial and Aerial Conductors and Cables:

1. Type USE/RHH/RHW insulation, UL 854 listed, or Type RHW-2/USE-2.
2. Conform to physical and minimum thickness requirements of NEMA WC 70.

E. Flexible Cords and Cables:

1. Type SOW-A/50 with ethylene propylene rubber insulation in accordance with UL 62.
2. Conform to physical and minimum thickness requirements of NEMA WC 70.

2.02 600-VOLT RATED CABLE

A. General:

1. Type TC, meeting requirements of UL 1277, including Vertical Tray Flame Test at 70,000 Btu per hour, and NFPA 70, Article 340, or UL 13 meeting requirements of NFPA 70, Article 725.
2. Permanently and legibly marked with manufacturer’s name, maximum working voltage for which cable was tested, type of cable, and NRTL listing mark.
3. Suitable for installation in open air, in cable trays, or conduit.
5. Overall Outer Jacket: PVC, flame-retardant, sunlight- and oil-resistant.
B. Type 1, Multiconductor Control Cable:

1. Conductors:
   a. 14 AWG, seven-strand copper.
   b. Insulation: 15-mil PVC with 4-mil nylon.
   c. UL 1581 listed as Type THHN/THWN rated VW-1.
   d. Conductor group bound with spiral wrap of barrier tape.
   e. Color Code: In accordance with ICEA S-58-679, Method 1, Table 2.

2. Cable: Passes the ICEA T-29-520, 210,000 Btu per hour Vertical Tray Flame Test.

3. Cable Sizes:

4. Manufacturers:
   a. Okonite Co.
   b. Southwire.

C. Type 3, 16 AWG, Twisted, Shielded Pair, Instrumentation Cable: Single pair, designed for noise rejection for process control, computer, or data log applications meeting NEMA WC 57 requirements.

1. Outer Jacket: 45-mil nominal thickness.
2. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer overlapped to provide 100 percent coverage.
3. Dimension: 0.31-inch nominal OD.
4. Conductors:
   a. Bare soft annealed copper, Class B, seven-strand concentric, meeting requirements of ASTM B8.
   b. 20 AWG, seven-strand tinned copper drain wire.
   c. Insulation: 15-mil nominal PVC.
d. Jacket: 4-mil nominal nylon.  
  e. Color Code: Pair conductors, black and red.  

5. Manufacturers:  
  a. Okonite Co.  
  b. Alpha Wire Corp.  
  c. Belden.  

D. Type 4, 16 AWG, Twisted, Shielded Triad Instrumentation Cable: Single triad, designed for noise rejection for process control, computer, or data log applications meeting NEMA WC 57 requirements.  

1. Outer Jacket: 45-mil nominal.  
2. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer, overlapped to provide 100 percent coverage.  
3. Dimension: 0.32-inch nominal OD.  
4. Conductors:  
   a. Bare soft annealed copper, Class B, seven-strand concentric, meeting requirements of ASTM B8.  
   b. 20 AWG, seven-strand, tinned copper drain wire.  
   c. Insulation: 15-mil nominal PVC.  
   d. Jacket: 4-mil nylon.  
   e. Color Code: Triad conductors black, red, and blue.  
5. Manufacturers:  
   a. Okonite Co.  
   b. Alpha Wire Corp.  
   c. Belden.  

E. Type 5, 18 AWG, Multitwisted Shielded Pairs, with a Common Overall Shield, Instrumentation Cable: Designed for use as instrumentation, process control, and computer cable, meeting NEMA WC 57 requirements.  

1. Conductors:  
   a. Bare soft annealed copper, Class B, seven-strand concentric, in accordance with ASTM B8.  
   b. Tinned copper drain wires.  
   c. Pair drain wire size AWG 20, group drain wire size AWG 18.  
   d. Insulation: 15-mil PVC.  
   e. Jacket: 4-mil nylon.  
   f. Color Code: Pair conductors, black and red with red conductor numerically printed for group identification.  
   g. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer.  
2. Cable Shield: 2.35-mil, double-faced aluminum/synthetic polymer, overlapped for 100 percent coverage.
3. Cable Sizes:

   c. Belden.

2.03 SPECIAL CABLES

A. Type 30, Unshielded Twisted Pair (UTP) Telephone and Data Cable, 300V:
   1. Category 6 UTP, UL listed, and third party verified to comply with TIA/EIA 568-C Category 6 requirements.
   2. Suitable for high speed network applications including gigabit ethernet and video. Cable shall be interoperable with other standards compliant products and shall be backward compatible with Category 5 and Category 5e.
   3. Provide four each individually twisted pair, 23 AWG conductors, with FEP insulation and blue PVC jacket.
   4. NFPA 70 Plenum (CMP) rated; comply with flammability plenum requirements of NFPA 70 and NFPA 262.
   5. Cable shall withstand a bend radius of 1-inch minimum at a temperature of minus 20 degrees C maximum without jacket or insulation cracking.
   6. Manufacturer and Product: Belden; 7852A.

B. Specific Instrumentation and Fiber Optic cables as specified on Drawings. See Electrical Legend Sheet 2.
2.04 GROUNDING CONDUCTORS

A. Equipment and Grounding Electrode: Stranded copper with green, Type XHHW-2, insulation, 600V ac.

B. Direct Buried: Bare stranded copper, tin-coated.

2.05 ACCESSORIES FOR CONDUCTORS 600 VOLTS AND BELOW

A. Tape:

1. General Purpose, Flame Retardant: 7-mil, vinyl plastic, Scotch Brand 33+, rated for 90 degrees C minimum, meeting requirements of UL 510.

3. Arc and Fireproofing:
   a. 30-mil, elastomer.
   b. Manufacturers and Products:
      1) 3M; Scotch Brand 77, with Scotch Brand 69 glass cloth tapebinder.
      2) Plymouth; 53 Plyarc, with 77 Plyglas glass cloth tapebinder.

B. Identification Devices:

1. Sleeve:
   a. Permanent, PVC, yellow or white, with legible machine-printed black markings.
   b. Manufacturers and Products:
      1) Raychem; Type D-SCE or ZH-SCE.
      2) Brady, Type 3PS.

2. Heat Bond Marker:
   a. Transparent thermoplastic heat bonding film with acrylic pressure sensitive adhesive.
   b. Self-laminating protective shield over text.
   c. Machine printed black text.
   d. Manufacturer and Product: 3M Co.; Type SCS-HB.

3. Marker Plate: Nylon, with legible designations permanently hot stamped on plate.

4. Tie-On Cable Marker Tags:
   a. Chemical-resistant white tag.
   b. Size: 1/2 inch by 2 inches.
   c. Manufacturer and Product: Raychem; Type CM-SCE.

5. Grounding Conductor: Permanent green heat-shrink sleeve, 2-inch minimum.
C. Connectors and Terminations:

1. Nylon, Self-Insulated Crimp Connectors:
   a. Manufacturers and Products:
      1) Thomas & Betts; Sta-Kon.
      2) Burndy; Insulug.
      3) ILSCO.

2. Nylon, Self-Insulated, Crimp Locking-Fork, Torque-Type Terminator:
   a. Suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.
   b. Seamless.
   c. Manufacturers and Products:
      1) Thomas & Betts; Sta-Kon.
      2) Burndy; Insulink.
      3) ILSCO; ILSCONS.

   a. UL 486C.
   b. Plated steel, square wire springs.
   c. Manufacturers and Products:
      1) Thomas & Betts.
      2) Ideal; Twister.

4. Self-Insulated, Set Screw Wire Connector:
   a. Two piece compression type with set screw in brass barrel.
   b. Insulated by insulator cap screwed over brass barrel.
   c. Manufacturers:
      1) 3M Co.
      2) Thomas & Betts.
      3) Marrette.

D. Cable Lugs:

1. In accordance with NEMA CC 1.
2. Rated 600 volts of same material as conductor metal.
3. Uninsulated Crimp Connectors and Terminators:
   a. Suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.
   b. Manufacturers and Products:
      1) Thomas & Betts; Color-Keyed.
      2) Burndy; Hydent.
      3) ILSCO.
4. Uninsulated, Bolted, Two-Way Connectors and Terminators:
   a. Manufacturers and Products:
      1) Thomas & Betts; Locktite.
      2) Burndy; Quiklug.
      3) ILSCO.

E. Cable Ties:
   1. Nylon, adjustable, self-locking, and reusable.
   2. Manufacturer and Product: Thomas & Betts; TY-RAP.

F. Heat Shrinkable Insulation:
   1. Thermally stabilized cross-linked polyolefin.
   2. Single wall for insulation and strain relief.
   3. Dual Wall, adhesive sealant lined, for sealing and corrosion resistance.
   4. Manufacturers and Products:
      a. Thomas & Betts; SHRINK-KON.
      b. Raychem; RNF-100 and ES-2000.

2.06 PULLING COMPOUND

A. Nontoxic, noncorrosive, noncombustible, nonflammable, water-based lubricant; UL listed.

B. Suitable for rubber, neoprene, PVC, polyethylene, hypalon, CPE, and lead-covered wire and cable.

C. Approved for intended use by cable manufacturer.

D. Suitable for zinc-coated steel, aluminum, PVC, bituminized fiber, and fiberglass raceways.

E. Manufacturers:
   1. Ideal Co.
   2. Polywater, Inc.
   3. Cable Grip Co.

2.07 WARNING TAPE

A. As specified in Section 26 05 33, Raceway and Boxes.
ZINK DAM IMPROVEMENTS

2.08 SOURCE QUALITY CONTROL

A. Conductors 600 Volts and Below: Test in accordance with UL 44 and UL 854.

PART 3 EXECUTION

3.01 GENERAL

A. Conductor installation shall be in accordance with manufacturer’s recommendations.

B. Conductor and cable sizing shown is based on copper conductors, unless noted otherwise.

C. Do not exceed cable manufacturer’s recommendations for maximum pulling tensions and minimum bending radii.

D. Terminate conductors and cables, unless otherwise indicated.

E. Tighten screws and terminal bolts in accordance with UL 486A-486B for copper conductors and aluminum conductors.

F. Cable Lugs: Provide with correct number of holes, bolt size, and center-to-center spacing as required by equipment terminals.

G. Bundling: Where single conductors and cables in manholes, handholes, vaults, cable trays, and other indicated locations are not wrapped together by some other means, bundle conductors from each conduit throughout their exposed length with cable ties placed at intervals not exceeding 18 inches on center.

H. Ream, remove burrs, and clear interior of installed conduit before pulling wires or cables.

I. Concrete-Encased Raceway Installation: Prior to installation of conductors, pull through each raceway a mandrel approximately 1/4 inch smaller than raceway inside diameter.

3.02 POWER CONDUCTOR COLOR CODING

A. Conductors 600 Volts and Below:

1. 6 AWG and Larger: Apply general purpose, flame retardant tape at each end, and at ALL accessible locations wrapped at least six full overlapping turns, covering area 1-1/2 inches to 2 inches wide.

2. 8 AWG and Smaller: Provide colored conductors.
3. Colors:

</tbody>
</table>

Note: Phase A, B, C implies direction of positive phase rotation.

4. Tracer: Outer covering of white with identifiable colored strip, other than green, in accordance with NFPA 70.

3.03 CIRCUIT IDENTIFICATION

A. Identify power, instrumentation, and control conductor circuits at each termination, and in ALL accessible locations such as manholes, handholes, panels, switchboards, motor control centers, pull boxes, and terminal boxes.

B. Circuit Names:

C. Circuits Not Appearing in Circuit Schedules:

1. Assign circuit name based on device or equipment at load end of circuit.
2. Where this would result in same name being assigned to more than one circuit, add number or letter to each otherwise identical circuit name to make it unique.

D. Method:

1. Conductors 3 AWG and Smaller: Identify with sleeves or heat bond markers.
2. Cables and Conductors 2 AWG and Larger:
   a. Identify with marker plates or tie-on cable marker tags.
   b. Attach with nylon tie cord.
3. Taped-on markers or tags relying on adhesives not permitted.

3.04 CONDUCTORS 600 VOLTS AND BELOW

A. Install 10 AWG or 12 AWG conductors for branch circuit power wiring in lighting and receptacle circuits, or as indicated on Drawings.

B. Do not splice incoming service conductors and branch power distribution conductors 6 AWG and larger, unless specifically indicated or approved by Engineer.

C. Connections and Terminations:

1. Install wire nuts only on solid conductors. Wire nuts are not allowed on stranded conductors.
2. Install nylon self-insulated crimp connectors and terminators for instrumentation and control, circuit conductors.
4. Install uninsulated crimp connectors and terminators for instrumentation, control, and power circuit conductors 4 AWG through 2/0 AWG.
5. Install uninsulated, bolted, two-way connectors and terminators for power circuit conductors 3/0 AWG and larger.
6. Install uninsulated terminators bolted together on motor circuit conductors 10 AWG and larger.
7. Place no more than one conductor in any single-barrel pressure connection.
8. Install crimp connectors with tools approved by connector manufacturer.
9. Install terminals and connectors acceptable for type of material used.
10. Compression Lugs:
   a. Attach with a tool specifically designed for purpose. Tool shall provide complete, controlled crimp and shall not release until crimp is complete.
   b. Do not use plier type crimpers.

D. Do not use soldered mechanical joints.

E. Conductor Splices: Not permitted unless specifically noted on Drawings.

F. Cap spare conductors with UL listed end caps.

G. Cabinets, Panels, and Motor Control Centers:
   1. Remove surplus wire, bridle and secure.
   2. Where conductors pass through openings or over edges in sheet metal, remove burrs, chamfer edges, and install bushings and protective strips of insulating material to protect the conductors.

H. Control and Instrumentation Wiring:
   1. Where terminals provided will accept such lugs, terminate control and instrumentation wiring, except solid thermocouple leads, with insulated, locking-fork compression lugs.
   2. Terminate with methods consistent with terminals provided, and in accordance with terminal manufacturer’s instructions.
   3. Locate splices in readily accessible cabinets or junction boxes using terminal strips.
   4. Where connections of cables installed under this section are to be made under Section 409001, Camera Network System, leave pigtails of adequate length for bundled connections.
   5. Cable Protection:
      a. Install individual wires, pairs, or triads in flex conduit under floor or grouped into bundles at least 1/2 inch in diameter.
      b. Maintain integrity of shielding of instrumentation cables.
      c. Ensure grounds do not occur because of damage to jacket over shield.

I. Extra Conductor Length: For conductors to be connected by others, install minimum 6 feet of extra conductor in freestanding panels and minimum 2 feet in other assemblies.

END OF SECTION
SECTION 26 05 26
GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1  GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. Institute of Electrical and Electronics Engineers (IEEE): C2, National Electrical Safety Code (NESC).

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Product data for the following:
      1) Exothermic weld connectors.
      2) Mechanical connectors.
      3) Compression connectors.
      4) Ground rods.
      5) Specialty tools.

1.03 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

1. Provide the Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, provide material and equipment labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ to provide a basis for approval under NEC.
2. Materials and equipment manufactured within the scope of standards published by UL shall conform to those Standards and shall have an applied NRTL Listing or Labeling mark.

PART 2  PRODUCTS

2.01 GROUND ROD

A. Material: Copper-clad.

2.02 GROUND CONDUCTORS

A. As specified in Section 26 05 05, Conductors.

2.03 CONNECTORS

A. Exothermic Weld Type:
   1. Outdoor Weld: Suitable for exposure to elements or direct burial.
   2. Indoor Weld: Use low-smoke, low-emission process.

B. Compression Type:
   1. Compress-deforming type; wrought copper extrusion material.
   2. Single indentation for conductors 6 AWG and smaller.
   3. Double indentation with extended barrel for conductors 4 AWG and larger.
   4. Barrels prefilled with oxide-inhibiting and antiseizing compound and sealed.
   5. Manufacturers and Products:
      a. Burndy Corp.; Hyground Irreversible Compression.
      b. Thomas and Betts Co.

C. Mechanical Type: Split-bolt, saddle, or cone screw type; copper alloy material.
   1. Manufacturers:
      a. Burndy Corp.
      b. Thomas and Betts Co.

2.04 GROUNDING WELLS

A. H20 Traffic-rated ground box complete with cast-iron riser ring and traffic cover marked “GROUND ROD”.

B. Manufacturers and Products:
PART 3    EXECUTION

3.01    GENERAL

A. Grounding: In compliance with NFPA 70 and IEEE C2.

B. Ground electrical service neutral at service entrance equipment with grounding electrode conductor to grounding electrode system.

C. Ground each separately derived system neutral with common grounding electrode conductor to grounding electrode system.

D. Bond together all grounding electrodes that are present at each building or structure served to form one common grounding electrode system.

E. Bond together system neutrals, service equipment enclosures, exposed noncurrent-carrying metal parts of electrical equipment, metal raceways, ground conductor in raceways and cables, receptacle ground connections, and metal piping systems.

F. Shielded Power Cables: Ground shields at each splice or termination in accordance with recommendations of splice or termination manufacturer.

G. Shielded Instrumentation Cables:
   1. Ground shield to ground bus at power supply for analog signal.
   2. Expose shield minimum 1 inch at termination to field instrument and apply heat shrink tube.
   3. Do not ground instrumentation cable shield at more than one point.

3.02    WIRE CONNECTIONS

A. Ground Conductors: Install in conduit containing power conductors and control circuits above 50 volts.

B. Nonmetallic Raceways and Flexible Tubing: Install equipment grounding conductor connected at both ends to noncurrent-carrying grounding bus.

C. Connect ground conductors to raceway grounding bushings.

D. Extend and connect ground conductors to ground bus in all equipment containing a ground bus.

E. Connect enclosure of equipment containing ground bus to that bus.

F. Bolt connections to equipment ground bus.
G. Bond grounding conductors to metallic enclosures at each end, and to intermediate metallic enclosures.

H. Junction Boxes: Furnish materials and connect to equipment grounding system with grounding clips mounted directly on box, or with 3/8-inch machine screws.

I. Metallic Equipment Enclosures: Use furnished ground lug; if none furnished, tap equipment housing and install solderless terminal connected to box with machine screw. For circuits greater than 20 amps use minimum 5/16-inch diameter bolt.

3.03 MOTOR GROUNDING

A. Extend equipment ground bus via grounding conductor installed in motor feeder raceway; connect to motor frame.

B. Nonmetallic Raceways and Flexible Tubing: Install an equipment grounding conductor connected at both ends to noncurrent-carrying grounding bus.

C. Motors Less Than 10 hp: Use furnished ground lug in motor connection box. If none furnished, provide compression, spade-type terminal connected to conduit box mounting screw.

D. Motors 10 hp and Above: Use furnished ground lug in motor connection box. If none furnished, tap motor frame or equipment housing; furnish compression, one-hole, lug type terminal connected with minimum 5/16-inch brass threaded stud with bolt and washer.

E. Circuits 20 Amps or Above: Tap motor frame or equipment housing. Install solderless terminal with minimum 5/16-inch diameter bolt.

3.04 GROUND RODS

A. Install full length with conductor connection at upper end.

B. Install with connection point below finished grade, unless otherwise shown.

C. Space multiple ground rods by one rod length.

D. Install to 8 feet below local frost depth, minimum.

3.05 GROUNDING WELLS

A. Install for ground rods located where indicated on Drawings.

B. Install riser ring and cover flush with surface.
C. Place 6 inches of crushed rock in bottom of each well.

3.06 CONNECTIONS

A. General:
   1. Abovegrade Connections: Install exothermic weld, mechanical, or compression-type connectors; or brazing.
   2. Belowgrade Connections: Install exothermic weld or compression type connectors.
   3. Remove paint, dirt, or other surface coverings at connection points to allow good metal-to-metal contact.
   4. Notify Engineer prior to backfilling ground connections.

B. Exothermic Weld Type:
   1. Wire brush or file contact point to bare metal surface.
   2. Use welding cartridges and molds in accordance with manufacturer’s recommendations.
   3. Avoid using badly worn molds.
   4. Mold to be completely filled with metal when making welds.
   5. After completed welds have cooled, brush slag from weld area and thoroughly clean joint.

C. Compression Type:
   1. Install in accordance with connector manufacturer’s recommendations.
   2. Install connectors of proper size for grounding conductors and ground rods specified.
   3. Install using connector manufacturer’s compression tool having proper sized dies and operate per manufacturer’s instructions.

D. Mechanical Type:
   1. Apply homogeneous blend of colloidal copper and rust and corrosion inhibitor before making connection.
   2. Install in accordance with connector manufacturer’s recommendations.
   3. Do not conceal mechanical connections.

3.07 METAL STRUCTURE GROUNDING

A. Bond metal sheathing and exposed metal vertical structural elements to grounding system.

B. Bond electrical equipment supported by metal platforms to the platforms.
C. Provide electrical contact between metal frames and railings supporting pushbutton stations, receptacles, and instrument cabinets, and raceways carrying circuits to these devices.

3.08 MANHOLE AND HANDHOLE GROUNDING

A. Install one ground rod inside each manhole and handhole larger than 24-inch by 24-inch inside dimensions.

B. Ground Rod Floor Protrusion: 4 inches to 6 inches above floor.

C. Make connections of grounding conductors fully visible and accessible.

D. Connect all noncurrent-carrying metal parts and any metallic raceway grounding bushings to ground rod with 6 AWG copper conductor.

3.09 TRANSFORMER GROUNDING

A. Bond neutrals of stepdown transformers to grounding electrode system.

3.10 LIGHTNING PROTECTION SYSTEMS

A. Bond lightning protection system ground terminals to building or structure grounding electrode system.

3.11 SURGE PROTECTION EQUIPMENT GROUNDING

A. Connect surge arrestor ground terminals to equipment ground bus.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

2. ASTM International (ASTM):

4. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
   b. C80.1, Electrical Rigid Steel Conduit (ERSC).
   c. C80.3, Steel Electrical Metallic Tubing (EMT).
   d. C80.5, Electrical Rigid Aluminum Conduit (ERAC).
   e. C80.6, Electrical Intermediate Metal Conduit (EIMC).
   f. RN 1, Polyvinyl Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit.
   g. TC 2, Electrical Polyvinyl Chloride (PVC) Conduit.
   h. TC 3, Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing.
   i. TC 6, Polyvinyl Chloride (PVC) Plastic Utilities Duct for Underground Installation.
   j. TC 14, Reinforced Thermosetting Resin Conduit (RTAC) and Fittings.
   k. VE 1, Metallic Cable Tray Systems.

7. UL:
a. 1, Standard for Safety for Flexible Metal Conduit.
b. 5, Standard for Safety for Surface Metal Raceways and Fittings.
c. 6, Standard for Safety for Electrical Rigid Metal Conduit – Steel.
d. 6A, Standard for Safety for Electrical Rigid Metal Conduit – Aluminum, Red Brass and Stainless.
e. 360, Standard for Safety for Liquid-Tight Flexible Steel Conduit.
f. 514B, Standard for Safety for Conduit, Tubing, and Cable Fittings.
g. 651, Standard for Safety for Schedule 40 and 80 Rigid PVC Conduit and Fittings.
h. 651A, Standard for Safety for Type EB and A Rigid PVC Conduit and HDPE Conduit.
i. 797, Standard for Safety for Electrical Metallic Tubing – Steel.
j. 870, Standard for Safety for Wireways, Auxiliary Gutters, and Associated Fittings.
k. 1242, Standard for Safety for Electrical Intermediate Metal Conduit – Steel.
l. 1660, Standard for Safety for Liquid-Tight Flexible Nonmetallic Conduit.
m. 1684, Standard for Safety for Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
n. 2024, Standard for Safety for Optical Fiber and Communication Cable Raceway.

1.02 SUBMITTALS

A. Action Submittals:

1. Manufacturer’s Literature:
a. Rigid galvanized steel conduit.
b. Rigid aluminum conduit.
c. PVC Schedule 40 conduit.
d. PVC Schedule 80 conduit.
e. PVC-coated rigid steel conduit.
f. Flexible metal, liquid-tight conduit.
g. Flexible, nonmetallic, liquid-tight conduit.
h. Conduit fittings.
i. Wireways.
j. Device boxes for use in hazardous areas.
k. Junction and pull boxes used at or belowgrade.
l. Large junction and pull boxes.
m. Terminal junction boxes.
2. Precast Manholes and Handholes:
   a. Dimensional drawings and descriptive literature.
   b. Traffic loading calculations.
   c. Accessory information.
3. Equipment and machinery proposed for bending metal conduit.
4. Method for bending PVC conduit less than 30 degrees.

B. Informational Submittals: Component and attachment testing seismic certificate of compliance as required by Section 26 05 02, Basic Electrical Requirements.

1.03 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):
   1. Provide the Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, material and equipment shall be labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ in order to provide a basis for approval under NEC.
   2. Materials and equipment manufactured within scope of standards published by UL shall conform to those standards and shall have an applied NRTL Listing or Labeling mark.

PART 2 PRODUCTS

2.01 CONDUIT AND TUBING

A. Rigid Galvanized Steel Conduit (RGS):
   1. Meet requirements of NEMA C80.1 and UL 6.

B. Rigid Aluminum Conduit:
   1. Meet requirements of NEMA C80.5 and UL 6A.
   2. Material: Type 6063, copper-free aluminum alloy.

C. PVC Schedule 40 Conduit:
   1. Meet requirements of NEMA TC 2 and UL 651.
   2. UL listed for concrete encasement, underground direct burial, concealed or direct sunlight exposure, and 90 degrees C insulated conductors.
   3. Furnish without factory-formed bell.
D. PVC Schedule 80 Conduit:
   1. Meet requirements of NEMA TC 2 and UL 651.
   2. UL listed for concrete encasement, underground direct burial, concealed or direct sunlight exposure, and 90 degrees C insulated conductors.

E. PVC-Coated Rigid Steel Conduit:
   1. Meet requirements of NEMA RN 1.
   2. Material:
      a. Meet requirements of NEMA C80.1 and UL 6.
      b. Exterior Finish: PVC coating, 40-mil nominal thickness; bond to metal shall have tensile strength greater than PVC.
   3. Threads: Hot-dipped galvanized and factory coated with urethane.
   4. Bendable without damage to interior or exterior coating.

F. Flexible Metal, Liquid-Tight Conduit:
   1. UL 360 listed for 105 degrees C insulated conductors.

G. Flexible, Nonmetallic, Liquid-Tight Conduit:
   1. Material: PVC core with fused flexible PVC jacket.
   2. UL 1660 listed for:
      a. Dry Conditions: 80 degrees C insulated conductors.
      b. Wet Conditions: 60 degrees C insulated conductors.
   3. Manufacturers and Products:
      a. Carlon; Carflex or X-Flex.
      b. T & B; Xtraflex LTC or EFC.

2.02 FITTINGS

A. Rigid Galvanized Steel Conduit:
   1. General:
      a. Meet requirements of UL 514B.
      b. Type: Threaded, galvanized. Set screw and threadless compression fittings not permitted.
   2. bushing:
      a. Material: Malleable iron with integral insulated throat, rated for 150 degrees C.
      b. Manufacturers and Products:
         1) Appleton; Series BU-I.
         2) O-Z/Gedney; Type HB.
3. Grounding Bushing:
   a. Material: Malleable iron with integral insulated throat rated for 150 degrees C, with solderless lugs.
   b. Manufacturers and Products:
      1) Appleton; Series GIB.
      2) O-Z/Gedney; Type HBLG.

4. Conduit Hub:
   a. Material: Malleable iron with insulated throat with bonding screw.
   b. UL listed for use in wet locations.
   c. Manufacturers and Products:
      1) Appleton; Series HUB-B.
      2) O-Z/Gedney; Series CH.
      3) Meyers; ST Series.

5. Conduit Bodies:
   a. Sized as required by NFPA 70.
   b. Manufacturers and Products (For Normal Conditions):
      1) Appleton; Form 35 threaded unilets.
      2) Crouse-Hinds; Form 7 or Form 8 threaded condulets.
      3) Killark; Series O electrolets.
      4) Thomas & Betts; Form 7 or Form 8.
   c. Manufacturers (For Hazardous Locations):
      1) Appleton.
      2) Crouse-Hinds.
      3) Killark.

6. Couplings: As supplied by conduit manufacturer.

7. Unions:
   a. Concrete tight, hot-dip galvanized malleable iron.
   b. Manufacturers and Products:
      1) Appleton; Series SCC bolt-on coupling or Series EC three-piece union.
      2) O-Z/Gedney; Type SSP split coupling or Type 4 Series, three-piece coupling.

8. Drain Seal:
   a. Manufacturers and Products:
      1) Appleton; Type EYD.
      2) Crouse-Hinds; Type EYD or Type EZD.

9. Drain/Breather Fitting:
   a. Manufacturers and Products:
      1) Appleton; Type ECDB.
      2) Crouse-Hinds; ECD.

10. Expansion Fitting:
    a. Manufacturers and Products:
       1) Deflection/Expansion Movement:
          a) Appleton; Type DF.
          b) Crouse-Hinds; Type XD.
2) Expansion Movement Only:
a) Appleton; Type XJ.
b) Crouse-Hinds; Type XJ.
c) Thomas & Betts; XJG-TP.

11. Cable Sealing Fitting:
a. To form watertight nonslip cord or cable connection to conduit.
b. For Conductors with OD of 1/2 inch or Less: Neoprene bushing at connector entry.
c. Manufacturers and Products:
   1) Appleton; CG-S.
   2) Crouse-Hinds; CGBS.

B. Rigid Aluminum Conduit:

1. General:
a. Meet requirements of UL 514B.
b. Type: Threaded, copper-free. Set screw fittings not permitted.

2. Insulated Bushing:
a. Material: Cast aluminum, with integral insulated throat, rated for 150 degrees C.
b. Manufacturer and Product: O-Z/Gedney; Type AB.

3. Grounding Bushing:
a. Material: Cast aluminum with integral insulated throat, rated for 150 degrees, with solderless lugs.
b. Manufacturer and Product: O-Z/Gedney; Type ABLG.

4. Conduit Hub:
a. Material: Cast aluminum, with insulated throat.
b. UL listed for use in wet locations.
c. Manufacturers and Products:
   1) O-Z/Gedney; Type CHA.
   2) Thomas & Betts; Series 370AL.
   3) Meyers; Series SA.

5. Conduit Bodies:
a. Manufacturers and Products (For Normal Conditions):
   1) Appleton; Form 85 threaded unilets.
   2) Crouse-Hinds; Mark 9 or Form 7-SA threaded condulets.
   3) Killark; Series O electrolets.
b. Manufacturers (For Hazardous Locations):
   1) Appleton.
   2) Crouse-Hinds.
   3) Killark.

6. Couplings: As supplied by conduit manufacturer.
7. Conduit Sealing Fitting:
   a. Manufacturers and Products:
      1) Appleton; Type EYF-AL or Type EYM-AL.
      2) Crouse-Hinds; Type EYS-SA or Type EZS-SA.
      3) Killark; Type EY or Type EYS.
8. Drain Seal:
   a. Manufacturers and Products:
      1) Appleton; Type EYDM-A.
      2) Crouse-Hinds; Type EYD-SA or Type EZD-SA.
9. Drain/Breather Fitting:
   a. Manufacturers and Products:
      1) Appleton; Type ECDB.
      2) Crouse-Hinds; ECD.
10. Expansion Fitting:
    a. Manufacturers and Products:
       1) Deflection/Expansion Movement: Steel City; Type DF-A.
       2) Expansion Movement Only: Steel City; Type AF-A.
11. Cable Sealing Fittings:
    a. To form watertight nonslip cord or cable connection to conduit.
    b. Bushing: Neoprene at connector entry.
    c. Manufacturer and Product: Appleton; CG-S.

C. PVC Conduit:
   1. Meet requirements of NEMA TC 3.
   2. Type: PVC, slip-on.

D. PVC-Coated Rigid Steel Conduit:
   1. Meet requirements of UL 514B.
   2. Fittings: Rigid galvanized steel type, PVC coated by conduit manufacturer.
   3. Conduit Bodies: Cast metal hot-dipped galvanized or urethane finish. Cover shall be of same material as conduit body. PVC coated by conduit manufacturer.
   5. Overlapping pressure-sealing sleeves.
   7. Manufacturers:
      a. Robroy Industries.
      b. Ocal.
   8. Expansion Fitting:
      a. Manufacturer and Product: Ocal; OCAL-BLUE XJG.
E. Flexible Metal, Liquid-Tight Conduit:
   1. Metal insulated throat connectors with integral nylon or plastic bushing rated for 105 degrees C.
   2. Insulated throat and sealing O-rings.
   3. Manufacturers and Products:
      a. Thomas & Betts; Series 5331.
      b. O-Z/Gedney; Series 4Q.

F. Flexible, Nonmetallic, Liquid-Tight Conduit:
   1. Meet requirements of UL 514B.
   2. Type: High strength plastic body, complete with lock nut, O-ring, threaded ferrule, sealing ring, and compression nut.
   3. Body/compression nut (gland) design to ensure high mechanical pullout strength and watertight seal.
   4. Manufacturers and Products:
      a. Carlon; Type LT.
      b. O-Z/Gedney; Type 4Q-P.
      c. Thomas & Betts; Series 6300.

G. Watertight Entrance Seal Device:
   1. New Construction:
      a. Material: Oversized sleeve, malleable iron body with sealing ring, pressure ring, grommet seal, and pressure clamp.
      b. Manufacturer and Product: O-Z/Gedney; Type FSK or Type WSK, as required.
   2. Cored-Hole Application:
      b. Manufacturer and Product: O-Z/Gedney; Series CSM.

2.03 OUTLET AND DEVICE BOXES

A. Cast Aluminum:
   1. Material:
      a. Box: Cast, copper-free aluminum.
      b. Cover: Gasketed, weatherproof, cast copper-free aluminum with stainless steel screws.
   2. Hubs: Threaded.
   3. Lugs: Cast mounting.
   4. Manufacturers and Products, Nonhazardous Locations:
      a. Crouse-Hinds; Type FS-SA or Type FD-SA.
      b. Appleton; Type FS or Type FD.
5. Manufacturers and Products, Hazardous Locations:
   a. Crouse-Hinds; Type GUA-SA.
   b. Appleton; Type GR.

2.04 JUNCTION AND PULL BOXES

A. Outlet Box Used as Junction or Pull Box: As specified under Article Outlet and Device Boxes.

B. Conduit Bodies Used as Junction Boxes: As specified under Article Fittings.

C. Large Cast Aluminum Box:
   1. NEMA 250 Type 4.
   2. Box: Cast copper-free aluminum, with drilled and tapped conduit entrances and exterior mounting lugs.
   3. Cover: Nonhinged.
   5. Hardware and Machine Screws: ASTM A167, Type 316 stainless steel.

D. Large Stainless Steel Box:
   1. NEMA 250 Type 4X.
   2. Box: 14-gauge, ASTM A240/A240M, Type 304 stainless steel.
   3. Cover: Hinged with clamps.
   5. Manufacturers:
      b. Robroy Industries.
      c. Wiegman.

E. Large Nonmetallic Box:
   1. NEMA 250 Type 4X.
   2. Box: High-impact, fiberglass-reinforced polyester or engineered thermoplastic, with stability to high heat.
   3. Cover: Hinged with clamps.
   5. Conduit hubs and mounting lugs.
   6. Manufacturers and Products:
      a. Crouse-Hinds; Type NJB.
      b. Carlon; Series N, C, or H.
      c. Robroy Industries.
ZINK DAM IMPROVEMENT

F. Concrete Box, All Areas:

1. Box: Reinforced, cast concrete with extension and bottom slab.
2. Cover: Steel checked plate; H/20 loading with screw down.
3. Cover Marking: ELECTRICAL, TELEPHONE, or as shown.
4. Manufacturers and Products:
   a. Christy, Concrete Products, Inc.; B1017BOX.
   b. Utility Vault Co.; 3030 SB.

G. Special Junction/Pull Boxes: As shown on Drawings.

2.05 TERMINAL JUNCTION BOX

A. Cover: Hinged, unless otherwise shown.

B. Interior Finish: Paint with white enamel or lacquer.

C. Terminal Blocks:

1. Separate connection point for each conductor entering or leaving box.
2. Spare Terminal Points: 25 percent, minimum.

2.06 METAL WIREWAYS

A. Meet requirements of UL 870.

B. Type: Steel-enclosed, lay-in type.

C. Cover: Hinged with friction latch.

D. Rating: Outdoor raintight.

E. Finish: Rust inhibiting phosphatizing primer and gray baked enamel.

F. Hardware: Plated to prevent corrosion; screws installed toward the inside protected by spring nuts or otherwise guarded to prevent wire insulation damage.

G. Knockouts: Without knockouts, unless otherwise indicated.

H. Manufacturers:

1. Circle AW.
2. Hoffman.
3. Square D.
2.07 PRECAST MANHOLES AND HANDHOLES

A. Concrete Strength: Minimum, 3,000 psi compressive, in 28 days.

B. Loading: AASHTO, H-20 in accordance with ASTM C857.

C. Access: Provide cast concrete 6-inch or 12-inch risers and access hole adapters between top of manhole and finished grade at required elevations.

D. Drainage:
   1. Slope floors toward drain points, leaving no pockets or other nondraining areas.
   2. Provide drainage outlet or sump at low point of floor constructed with a heavy, cast iron, slotted or perforated hinged cover, and a minimum 4-inch outlet and outlet pipe.

E. Raceway Entrances:
   1. Provide on all four sides.
   2. Provide knockout panels or precast individual raceway openings.
   3. At entrances where raceways are to be installed by others, provide minimum 12-inch-high by 24-inch-wide knockout panels for future raceway installation.

F. Embedded Pulling Iron:
   1. Material: 3/4-inch-diameter stock, fastened to overall steel reinforcement before concrete is placed.
   2. Location:
      a. Wall: Opposite each raceway entrance and knockout panel for future raceway entrance.
      b. Floor: Centered below manhole or handhole cover.

G. Cable Racks:
   1. Arms and Insulators: Adjustable, of sufficient number to accommodate cables for each raceway entering or leaving manhole, including spares.
   2. Wall Attachment:
      a. Adjustable inserts in concrete walls. Bolts or embedded studs not permitted.
      b. Insert Spacing: Maximum 3 feet on center for inside perimeter of manhole.
      c. Arrange in order that spare raceway ends are clear for future cable installation.
H. Manhole Frames and Covers:
   1. Material: Machined cast iron.
   2. Diameter: 36-1/2 inch.
   3. Cover Type: Indented, solid top design, with two drop handles each.
   5. Cover Designation: Cast, on upper side, in integral letters, minimum 2 inches in height, appropriate titles:
      a. 600 Volts and Below: ELECTRIC LV.

I. Handhole Frames and Covers:
   1. Material: Steel, hot-dipped galvanized.
   2. Cover Type: Solid, bolt-on, of checkered nonskid design.
   4. Cover Designation: Burn by welder, on upper side in integral letters, minimum 2 inches in height, appropriate titles:
      a. 600 Volts and Below: ELECTRIC LV.

J. Hardware: Steel, hot-dip galvanized.

K. Furnish knockout for ground rod in each handhole and manhole.

L. Manufacturers:
   1. Utility Vault Co.
   2. Penn-Cast Products, Inc.
   3. Concrete Conduit Co.
   4. Associated Concrete Products, Inc.
   5. Pipe, Inc.

2.08 ACCESSORIES

A. Duct Bank Spacers:
   1. Modular Type:
      a. Nonmetallic, interlocking, for multiple conduit sizes.
      b. Suitable for all types of conduit.
      c. Manufacturers:
         1) Underground Device, Inc.
         2) Carlon.
B. Identification Devices:

1. Raceway Tags:
   b. Shape: Round.
   c. Raceway Designation: Pressure stamped, embossed, or engraved.
   d. Tags relying on adhesives or taped-on markers not permitted.

2. Warning Tape:
   a. Material: Polyethylene, 4-mil gauge with detectable strip.
   b. Color: Red.
   c. Width: Minimum 6 inches.
   d. Designation: Warning on tape that electric circuit is located below tape.
   e. Identifying Letters: Minimum 1-inch-high permanent black lettering imprinted continuously over entire length.

3. Buried Raceway Marker:
   a. Material: Sheet bronze, consisting of double-ended arrows, straight for straight runs and bent at locations where runs change direction.
   b. Designation: Engrave to depth of 3/32 inch; ELECTRIC CABLES, in letters 1/4-inch high.
   c. Minimum Dimension: 1/4 inch thick, 10 inches long, and 3/4 inch wide.

C. Heat Shrinkable Tubing:

2. Semi-flexible with meltable adhesive inner liner.
4. Manufacturers:
   a. Raychem.
   b. 3M.

D. Wraparound Duct Band:

1. Material: Heat-shrinkable, cross-linked polyolefin, precoated with hot-melt adhesive.
2. Width: 50 mm minimum.
3. Manufacturer and Product: Raychem; Type TWDB.
PART 3 EXECUTION

3.01 GENERAL

A. Conduit and tubing sizes shown are based on use of copper conductors.
B. Comply with NECA Installation Standards.
C. Crushed or deformed raceways not permitted.
D. Maintain raceway entirely free of obstructions and moisture.
E. Immediately after installation, plug or cap raceway ends with watertight and dust-tight seals until time for pulling in conductors.
F. Sealing Fittings: Provide drain seal in vertical raceways where condensate may collect above sealing fitting.
G. Avoid moisture traps where possible. When unavoidable in exposed conduit runs, provide junction box and drain fitting at conduit low point.
H. Group raceways installed in same area.
I. Proximity to Heated Piping: Install raceways minimum 12 inches from parallel runs.
J. Follow structural surface contours when installing exposed raceways. Avoid obstruction of passageways.
K. Run exposed raceways parallel or perpendicular to walls, structural members, or intersections of vertical planes.
L. Block Walls: Do not install raceways in same horizontal course or vertical cell with reinforcing steel.
M. Install watertight fittings in outdoor, underground, or wet locations.
N. Paint threads and cut ends, before assembly of fittings, galvanized conduit, installed in exposed or damp locations with zinc-rich paint or liquid galvanizing compound.
O. Metal conduit shall be reamed, burrs removed, and cleaned before installation of conductors, wires, or cables.
P. Do not install raceways in concrete equipment pads, foundations, or beams without Engineer approval.
Q. Horizontal raceways installed under floor slabs shall lie completely under slab, with no part embedded within slab.

R. Install concealed, embedded, and buried raceways so that they emerge at right angles to surface and have no curved portion exposed.

S. Install conduits for fiber optic cables, and Category 6 data cables in strict conformance with the requirements of TIA 569B.

3.02 INSTALLATION IN CAST-IN-PLACE STRUCTURAL CONCRETE

A. Minimum Cover: 2 inches, including fittings.

B. Conduit placement shall not require changes in reinforcing steel location or configuration.

C. Provide nonmetallic support during placement of concrete to ensure raceways remain in position.

D. Conduit larger than 1 inch shall not be embedded in concrete slabs, walls, foundations, columns, or beams unless approved by Engineer.

E. Slabs and Walls (Requires Engineer Approval):

1. Trade size of conduit not to exceed one-fourth of slab or wall thickness.
2. Install within middle two-fourths of slab or wall.
3. Separate conduit less than 2-inch trade size by a minimum ten times conduit trade size, center-to-center, unless otherwise shown.
4. Separate conduit 2-inch and greater trade size by a minimum eight times conduit trade size, center-to-center, unless otherwise shown.
5. Cross conduit at an angle greater than 45 degrees, with minimum separation of 1 inch.
6. Separate conduit by a minimum six times the outside dimension of expansion/deflection fittings at expansion joints.
7. Conduit shall not be installed below the maximum water surface elevation in walls of water holding structures.

F. Columns and Beams (Requires Engineer Approval):

1. Trade size of conduit not to exceed one-fourth of beam thickness.
2. Conduit cross-sectional area not to exceed 4 percent of beam or column cross section.
3.03 CONDUIT APPLICATION

A. Diameter: As indicated on Drawings, minimum 3/4 inch.

B. Exterior, Exposed:
   1. Rigid aluminum.
   2. PVC-coated rigid galvanized steel.

C. Interior, Exposed:
   1. Rigid galvanized steel (areas classified as “Dry”).
   2. Rigid aluminum (areas classified as “Wet” or “Damp”).

D. Interior, Concealed (Not Embedded in Concrete): Rigid galvanized steel.

E. Aboveground, Embedded in Concrete Walls, Ceilings, or Floors: Rigid galvanized steel.

F. Direct Earth Burial:
   1. PVC Schedule 80 for ac circuits.
   2. PVC-coated rigid steel for dc and analog circuits.

G. Concrete-Encased Ductbank:
   1. PVC Schedule 80 for ac circuits.
   2. Rigid galvanized steel for afd, dc, and analog circuits.

H. Under Slabs-On-Grade:
   1. PVC Schedule 40 for ac circuits.
   2. PVC-coated rigid steel for afd, dc, and analog circuits.

I. Transition from Underground or Concrete Embedded to Exposed: PVC-coated rigid steel.

3.04 FLEXIBLE CONNECTIONS

A. For motors, wall or ceiling mounted fans and unit heaters, dry type transformers, electrically operated valves, instrumentation, and other locations approved by Engineer where flexible connection is required to minimize vibration:

1. Conduit Size 4 Inches or Less: Flexible, nonmetallic liquid-tight, Type LNFC-B.
3. Wet or Corrosive Areas: Flexible, nonmetallic liquid-tight, Type LNFC-B.
4. Dry Areas: Flexible, nonmetallic liquid-tight, Type LNFC-B.

B. Suspended Luminaires in Dry Areas: Flexible steel, liquid-tight conduit.

C. Outdoor Areas, Process Areas Exposed to Moisture, and Areas Required to be Oiltight and Dust-Tight: Flexible metal, liquid-tight conduit.

D. Flexible Conduit Length: 18 inches minimum, 60 inches maximum; sufficient to allow movement or adjustment of equipment. Conduit to be supported at intervals as indicated on Drawings, but at spacings no greater than allowed by the NEC.

3.05 PENETRATIONS

A. Make at right angles, unless otherwise shown.

B. Notching or penetration of structural members, including footings and beams, not permitted.

C. Fire Rated Walls: Firestop openings around penetrations to maintain existing fire rating of the structure being penetrated.

D. Apply heat shrinkable tubing or single layer of wraparound duct band to metallic conduit protruding through concrete floor slabs to a point 2 inches above and 2 inches below concrete surface.

E. Concrete Walls, Floors, or Ceilings (Aboveground): Provide nonshrink grout dry-pack, or use watertight seal device.

1. PVC-coated rigid conduit shall extend through concrete slabs to a minimum of 6 inches above concrete surface.
F. Entering Structures:

1. General: Seal raceway at first box or outlet with oakum or expandable plastic compound to prevent entrance of gases or liquids from one area to another.

2. Concrete Roof or Membrane Waterproofed Wall or Floor:
   a. Provide a watertight seal.
   b. Without Concrete Encasement: Install watertight entrance seal device on each side.
   c. With Concrete Encasement: Install watertight entrance seal device on accessible side.
   d. Securely anchor malleable iron body of watertight entrance seal device into construction with one or more integral flanges.
   e. Secure membrane waterproofing to watertight entrance seal device in a permanent, watertight manner.

3. Heating, Ventilating, and Air Conditioning Equipment:
   a. Penetrate equipment in area established by manufacturer.
   b. Terminate conduit with flexible metal conduit at junction box or condulet attached to exterior surface of equipment prior to penetrating equipment.
   c. Seal conduit entering equipment panel boards and field panels containing electronic equipment.
   d. Seal penetration with Type 5 sealant, as specified in Section 07 92 00, Joint Sealants.

4. Nonwaterproofed Wall or Floor (Underground, without Concrete Encasement):
   a. Provide Schedule 40 galvanized pipe sleeve, or watertight entrance seal device.
   b. Fill space between raceway and sleeve with expandable plastic compound or oakum and lead joint, on each side.

5. Manholes and Handholes:
   c. Install such that raceways enter as near as possible to one end of wall, unless otherwise shown.

3.06 SUPPORT

A. Support from structural members only, at intervals not exceeding NFPA 70 requirements. Do not exceed 10 feet in any application. Do not support from piping, pipe supports, or other raceways.

B. Multiple Adjacent Raceways: Provide ceiling trapeze. For trapeze-supported conduit, allow 20 percent extra space for future conduit.
C. Application/Type of Conduit Strap:

1. Aluminum Conduit: Aluminum or stainless steel.
2. Rigid Steel Conduit: Zinc coated steel or pre-galvanized steel.
3. PVC-Coated Rigid Steel Conduit: PVC-coated metal.
4. Nonmetallic Conduit: Nonmetallic, PVC-coated metal or stainless steel.

D. Provide and attach wall brackets, strap hangers, or ceiling trapeze as follows:

1. Wood: Wood screws.
2. Hollow Masonry Units: Toggle bolts.
3. Concrete or Brick: Expansion shields, or threaded studs driven in by powder charge, with lock washers and nuts.
5. Location/Type of Hardware:
   a. Dry, Noncorrosive Areas: Galvanized.
   b. Wet, Noncorrosive Areas: Stainless steel.
   c. Corrosive Areas: Stainless steel.

E. Nails or wooden plugs inserted in concrete or masonry for attaching raceway not permitted. Do not weld raceways or pipe straps to steel structures. Do not use wire in lieu of straps or hangers.

F. Support aluminum conduit on concrete surfaces with stainless steel or nonmetallic spacers, or aluminum or nonmetallic framing channel.

3.07 BENDS

A. Install concealed raceways with a minimum of bends in the shortest practical distance.

B. Make bends and offsets of longest practical radius. Bends in conduits and ducts being installed for fiber optic cables shall be not less than 20 times cable diameter, 15 inches minimum.

C. Install with symmetrical bends or cast metal fittings.

D. Avoid field-made bends and offsets, but where necessary, make with acceptable hickey or bending machine. Do not heat metal raceways to facilitate bending.

E. Make bends in parallel or banked runs from same center or centerline with same radius so that bends are parallel.

F. Factory elbows may be installed in parallel or banked raceways if there is change in plane of run, and raceways are same size.
G. PVC Conduit:
   2. 90-Degree Bends: Provide rigid steel elbows.
   3. Use manufacturer’s recommended method for forming smaller bends.

H. Flexible Conduit: Do not make bends that exceed allowable conductor bending radius of cable to be installed or that significantly restricts conduit flexibility.

3.08 EXPANSION/DEFLECTION FITTINGS
A. Provide on raceways at structural expansion joints and in long tangential runs.

B. Provide expansion/deflection joints for 25 degrees F maximum temperature variation.

C. Install in accordance with manufacturer’s instructions.

3.09 PVC CONDUIT
A. Solvent Welding:
   1. Apply manufacturer recommended solvent to joints.
   2. Install in order that joint is watertight.

B. Adapters:
   1. PVC to Metallic Fittings: PVC terminal type.
   2. PVC to Rigid Metal Conduit: PVC female adapter.

C. Belled-End Conduit: Bevel unbelled end of joint prior to joining.

3.10 PVC-COATED RIGID STEEL CONDUIT
A. Install in accordance with manufacturer’s instructions.

B. Tools and equipment used in cutting, bending, threading and installation of PVC-coated rigid conduit shall be designed to limit damage to PVC coating.

C. Provide PVC boot to cover exposed threading.
3.11 WIREWAYS

A. Install in accordance with manufacturer’s instructions.

B. Locate with cover on accessible vertical face of wireway, unless otherwise shown.

C. Applications:
   1. Metal wireway in indoor dry locations.
   2. Nonmetallic wireway in indoor wet, outdoor, and corrosive locations.

3.12 TERMINATION AT ENCLOSURES

A. Cast Metal Enclosure: Install manufacturer’s premolded insulating sleeve inside metallic conduit terminating in threaded hubs.

B. Nonmetallic, Cabinets, and Enclosures:
   1. Terminate conduit in threaded conduit hubs, maintaining enclosure integrity.
   2. Metallic Conduit: Provide ground terminal for connection to maintain continuity of ground system.

C. Sheet Metal Boxes, Cabinets, and Enclosures:
   1. General:
      a. Install insulated bushing on ends of conduit where grounding is not required.
      b. Provide insulated throat when conduit terminates in sheet metal boxes having threaded hubs.
      c. Utilize sealing locknuts or threaded hubs on sides and bottom of NEMA 3R and NEMA 12 enclosures.
      d. Terminate conduits at threaded hubs at the tops of NEMA 3R and NEMA 12 boxes and enclosures.
      e. Terminate conduits at threaded conduit hubs at NEMA 4 and NEMA 4X boxes and enclosures.
   2. Rigid Galvanized Conduit:
      a. Provide one lock nut each on inside and outside of enclosure.
      b. Install grounding bushing at source enclosure.
      c. Provide bonding jumper from grounding bushing to equipment ground bus or ground pad.
   3. Flexible Metal Conduit: Provide two screw type, insulated, malleable iron connectors.
5. PVC Schedule 40 Conduit: Provide PVC terminal adapter with lock nut, except where threaded hubs required above.

D. Motor Control Center, Switchgear, and Free-Standing Enclosures:
   1. Terminate metal conduit entering bottom with grounding bushing; provide grounding jumper extending to equipment ground bus or grounding pad.
   2. Terminate PVC conduit entering bottom with bell end fittings.

3.13 UNDERGROUND RACEWAYS

A. Grade: Maintain minimum grade of 4 inches in 100 feet, either from one manhole, handhole, or pull box to the next, or from a high point between them, depending on surface contour.

B. Cover: Maintain minimum 2-foot cover above conduit unless otherwise shown.

C. Make routing changes as necessary to avoid obstructions or conflicts.

D. Couplings: In multiple conduit runs, stagger so couplings in adjacent runs are not in same transverse line.

E. Union type fittings not permitted.

F. Spacers:
   1. Provide preformed, nonmetallic spacers designed for such purpose, to secure and separate parallel conduit runs in a trench or concrete encasement.
   2. Install at intervals not greater than that specified in NFPA 70 for support of the type conduit used, but in no case greater than 10 feet.

G. Support conduit so as to prevent bending or displacement during backfilling or concrete placement.

H. Transition from Underground to Exposed: PVC-coated rigid steel conduit.

I. Installation with Other Piping Systems:
   1. Crossings: Maintain minimum 12-inch vertical separation.
   2. Parallel Runs: Maintain minimum 12-inch separation.
   3. Installation over valves or couplings not permitted.

J. Metallic Raceway Coating: At couplings and joints, apply wraparound duct band with one-half tape width overlap to obtain two complete layers.
K. Provide expansion fittings that allow minimum of 4 inches of movement in vertical conduit runs from underground where exposed conduit will be fastened to or will enter building or structure.

L. Provide expansion/deflection fittings in conduit runs that exit building or structure belowgrade.

M. Concrete Encasement: As specified in Section 03 30 00, Cast-in-Place Concrete.

N. Backfill:
   1. As specified in Section 31 23 23.15, Trench Backfill.
   2. Do not backfill until inspected by Engineer.

3.14 UNDER SLAB RACEWAYS

A. Make routing changes as necessary to avoid obstructions or conflicts.

B. Support raceways so as to prevent bending or displacement during backfilling or concrete placement.

C. Install raceways with no part embedded within slab and with no interference with slab on grade construction.

D. Raceway spacing, in a single layer or multiple layers:
   1. 3 inches clear between adjacent 2-inch or larger raceway.
   2. 2 inches clear between adjacent 1-1/2-inch or smaller raceway.

E. Multiple Layers of Raceways: Install under slab on grade in trench below backfill zone, as specified in Section 31 23 23.15, Trench Backfill.

F. Individual Raceways and Single Layer Multiple Raceways: Install at lowest elevation of backfill zone with spacing as specified herein. Where conduits cross at perpendicular orientation, installation of conduits shall not interfere with placement of under slab fill that meets compaction and void limitations of earthwork specifications.

G. Under slab raceways that emerge from below slab to top of slab as exposed, shall be located to avoid conflicts with structural slab rebar. Coordinate raceway stub ups with location of structural rebar.
H. Fittings:

1. Union type fittings are not permitted.
2. Provide expansion/deflection fittings in raceway runs that exit building or structure below slab. Locate fittings 18 inches, maximum, beyond exterior wall. Raceway type between building exterior wall to fitting shall be PVC-coated rigid steel.
3. Couplings: In multiple raceway runs, stagger so couplings in adjacent runs are not in same traverse line.

3.15 OUTLET AND DEVICE BOXES

A. General:

1. Install plumb and level.
2. Install suitable for conditions encountered at each outlet or device in wiring or raceway system, sized to meet NFPA 70 requirements.
3. Open no more knockouts in sheet steel device boxes than are required; seal unused openings.
4. Install galvanized mounting hardware in industrial areas.

B. Size:

1. Depth: Minimum 2 inches, unless otherwise required by structural conditions. Box extensions not permitted.
   a. Hollow Masonry Construction: Install with sufficient depth such that conduit knockouts or hubs are in masonry void space.
2. Ceiling Outlet: Minimum 4-inch octagonal device box, unless otherwise required for installed fixture.
3. Switch and Receptacle: Minimum 2-inch by 4-inch device box.

C. Locations:

1. Drawing locations are approximate.
2. To avoid interference with mechanical equipment or structural features, relocate outlets as directed by Engineer.
3. Luminaires: Install in symmetrical pattern according to room layout, unless otherwise shown.

D. Mounting Height:

1. General:
   a. Dimensions given to centerline of box.
   b. Where specified heights do not suit building construction or finish, adjust up or down to avoid interference.
   c. Do not straddle CMU block or other construction joints.
2. Light Switch:
   a. 48 inches above floor.
   b. When located next to door, install on lock side of door.
3. Thermostat: 54 inches above floor.
4. Convenience Receptacle:
   a. General Interior Areas: 24 inches above floor.
   b. Outdoor Areas: 24 inches above finished grade.
5. Switch, Motor Starting: 48 inches above floor, unless otherwise indicated on Drawings.

E. Flush Mounted:
   1. Install with concealed conduit.
   2. Install proper type extension rings or plaster covers to make edges of boxes flush with finished surface.
   3. Holes in surrounding surface shall be no larger than required to receive box.

F. Supports:
   1. Support boxes independently of conduit by attachment to building structure or structural member.
   2. Install bar hangers in frame construction or fasten boxes directly as follows:
      a. Wood: Wood screws.
      b. Concrete or Brick: Bolts and expansion shields.
      c. Hollow Masonry Units: Toggle bolts.
   3. Threaded studs driven in by powder charge and provided with lock washers and nuts are acceptable in lieu of expansion shields.
   4. Provide plaster rings where necessary.
   5. Boxes embedded in concrete or masonry need not be additionally supported.

G. Install separate junction boxes for flush or recessed lighting fixtures where required by fixture terminal temperature.

H. Boxes Supporting Fixtures: Provide means of attachment with adequate strength to support fixture.

3.16 JUNCTION AND PULL BOXES

A. General:
   1. Install plumb and level.
   2. Installed boxes shall be accessible.
3. Do not install on finished surfaces.
4. Use outlet boxes as junction and pull boxes wherever possible and allowed by applicable codes.
5. Use conduit bodies as junction and pull boxes where no splices are required and allowed by applicable codes.
6. Install pull boxes where necessary in raceway system to facilitate conductor installation.
7. Install where shown and where necessary to terminate, tap-off, or redirect multiple conduit runs.
8. Install in conduit runs at least every 150 feet or after the equivalent of three right-angle bends.

B. Flush Mounted:
   1. Install with concealed conduit.
   2. Holes in surrounding surface shall be no larger than required to receive box.
   3. Make edges of boxes flush with final surface.

C. Mounting Hardware:
   1. Noncorrosive Wet or Dry Areas: Stainless steel.
   2. Corrosive Areas: Stainless steel.

D. Supports:
   1. Support boxes independently of conduit by attachment to building structure or structural member.
   2. Install bar hangers in frame construction or fasten boxes directly as follows:
      a. Wood: Wood screws.
      b. Concrete or Brick: Bolts and expansion shields.
      c. Hollow Masonry Units: Toggle bolts.
   3. Threaded studs driven in by powder charge and provided with lock washers and nuts are acceptable in lieu of expansion shields.
   4. Boxes embedded in concrete or masonry need not be additionally supported.

E. At or Belowgrade:
   1. Install boxes for below grade conduit flush with finished grade in locations outside of paved areas, roadways, or walkways.
   2. If adjacent structure is available, box may be mounted on structure surface just above finished grade in accessible but unobtrusive location.
3. Obtain Engineer’s written acceptance prior to installation in paved areas, roadways, or walkways.
4. Use boxes and covers suitable to support anticipated weights.

F. Install Drain/breather fittings in NEMA 250 Type 4 and Type 4X enclosures.

3.17 MANHOLES AND HANDHOLES

A. Excavate, shore, brace, backfill, and final grade in accordance with Section 31 23 16, Excavation, and Section 31 23 23.15, Trench Backfill.

B. Do not install until final raceway grading has been determined.

C. Install such that raceway enters at nearly right angle and as near as possible to end of wall, unless otherwise shown.

D. Grounding: As specified in Section 26 05 26, Grounding and Bonding for Electrical Systems.

E. Identification: Field stamp covers with manhole or handhole number as shown. Stamped numbers to be 1-inch minimum height.

3.18 EMPTY RACEWAYS

A. Provide permanent, removable cap over each end.

B. Provide PVC plug with pull tab for underground raceways with end bells.

C. Provide nylon pull cord.

D. Identify, as specified in Article Identification Devices, with waterproof tags attached to pull cord at each end, and at intermediate pull point.

3.19 IDENTIFICATION DEVICES

A. Raceway Tags:

1. Identify origin and destination.
2. For exposed raceways, install tags at each terminus, near midpoint, and at minimum intervals of every 50 feet, whether in ceiling space or surface mounted.
3. Install tags at each terminus for concealed raceways.
4. Provide noncorrosive wire or nylon strap for attachment.

B. Warning Tape: Install approximately 12 inches above underground or concrete-encased raceways. Align parallel to, and within 12 inches of, centerline of run.
ZINK DAM IMPROVEMENT

C. Buried Raceway Marker:

1. Install at grade to indicate direction of underground raceway.
2. Install at bends and at intervals not exceeding 100 feet in straight runs.
3. Embed and secure to top of concrete base, sized 14 inches long, 6 inches wide, and 8 inches deep; top set flush with finished grade.

3.20 PROTECTION OF INSTALLED WORK

A. Protect products from effects of moisture, corrosion, and physical damage during construction.

B. Provide and maintain manufactured watertight and dust-tight seals over conduit openings during construction.

C. Touch up painted conduit threads after assembly to cover nicks or scars.

D. Touch up coating damage to PVC-coated conduit with patching compound approved by manufacturer. Compound shall be kept refrigerated according to manufacturers’ instructions until time of use.

PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

2. Institute of Electrical and Electronics Engineers, Inc. (IEEE):
   b. 242, Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems.
   c. 399, Recommended Practice for Industrial and Commercial Power System Analysis.
   d. 1584, Guide for Performing Arc Flash Hazard Calculations.
   a. 70, National Electrical Code (NEC).
   b. 70E, Standard for Electrical Safety in the Workplace.

1.02 SUBMITTALS

A. Action Submittals:

1. Short circuit study.
2. Protective Device Coordination Study: Submit along with Short Circuit Study.
3. Arc Flash Study: Submit along with Protective Device Coordination Study. Submit final study prior to equipment energization.
4. Arc Flash Warning Labels: Submit sample with initial study.
5. Electronic files on thumb drive of final studies including all engineering software input files, output reports, and libraries.

1.03 QUALITY ASSURANCE

A. Short circuit, protective device coordination, and arc flash studies shall be prepared either by manufacturer furnishing power distribution equipment, or by a professional electrical engineer registered in the State of Oklahoma.
1.04 SEQUENCING AND SCHEDULING

A. Initial complete short circuit study, protective device coordination study, and arc flash study shall be submitted and reviewed before Engineer will review Shop Drawings for any power distribution equipment.

B. Revised short circuit, protective device coordination, and arc flash studies, and arc flash labels shall be submitted 10 days before energizing electrical equipment.

C. Final short circuit, protective device coordination, and arc flash studies shall be completed prior to Project Substantial Completion. Final version of study shall include as-installed equipment, materials, and parameter data or settings entered into equipment based on study.

D. Submit final arc flash labels described herein and in compliance with NEMA Z535.4 prior to Project Substantial Completion.

1.05 GENERAL STUDY REQUIREMENTS

A. Equipment and component titles used in the studies shall be identical to equipment and component titles shown on Drawings.

B. Perform studies using one of the following electrical engineering software packages:
   2. ETAP.
   3. Paladin.
   4. Easy Power.

C. Perform complete fault calculations for each proposed source combination.
   1. Source combination may include present and future power company supply circuits, large motors, or generators.

D. Utilize proposed load data for study from Contract Documents.

E. Device coordination time-current curves for low-voltage distribution system; include individual protective device time-current characteristics.
1.06 SHORT CIRCUIT STUDY

A. General:

1. Prepare in accordance with IEEE 399.
2. Use cable impedances based on copper conductors, except where aluminum conductors are specified or shown.
3. Use bus impedances based on copper bus bars, except where aluminum bus bars are specified or shown.
4. Use cable and bus resistances calculated at 25 degrees C.
5. Use 600-volt cable reactances based on use of typical dimensions of XHHW-2 conductors.
6. Use transformer impedances 92.5 percent of “nominal” impedance based on tolerances specified in IEEE C57.12.00.

B. Provide:

1. Calculation methods and assumptions.
2. Typical calculation.
3. Tabulations of calculated quantities.
4. Results, conclusions, and recommendations.
5. Selected base per unit quantities.
6. One-line diagrams.
7. Source impedance data, including electric utility system and motor fault contribution characteristics.
8. Impedance diagrams.

C. Calculate short circuit interrupting and momentary (when applicable) duties for an assumed three-phase bolted fault at each:

1. Electric utility’s supply termination point.
2. Main (service-entrance) switchboard or panelboard.
3. Low-voltage switchboards.
5. Standby generators.
7. Future load contributions as shown on one-line diagram.

D. Provide bolted line-to-ground fault current study for areas as defined for three-phase bolted fault short circuit study.

E. Provide bolted line-to-line fault current study for areas as defined for three-phase bolted fault short circuit study.
F. Verify:

1. Equipment and protective devices are applied within their ratings.
2. Adequacy of switchboard and motor control centers bus bars to withstand short circuit stresses.
3. Adequacy of transformer windings to withstand short circuit stresses.
4. Cable and busway sizes for ability to withstand short circuit heating, in addition to normal load currents.

G. Tabulations:

1. General Data:
   a. Short circuit reactances of rotating machines.
   b. Cable and conduit material data.
   c. Bus data.
   d. Transformer data.
   e. Circuit resistance and reactance values.
2. Short Circuit Data (for each source combination):
   a. Fault impedances.
   b. X to R ratios.
   c. Asymmetry factors.
   d. Motor contributions.
   e. Short circuit kVA.
   f. Symmetrical and asymmetrical fault currents.
3. Equipment Evaluation:
   a. Equipment bus bracing, equipment short circuit rating, transformer, cable, busway.
   b. Maximum fault current available.

H. Written Summary:

1. Scope of studies performed.
2. Explanation of bus and branch numbering system.
3. Prevailing conditions.
4. Selected equipment deficiencies.
5. Results of short circuit study.
6. Comments or suggestions.

I. Suggest changes and additions to equipment rating and/or characteristics.

J. Notify Engineer in writing of existing circuit protective devices improperly rated for new fault conditions.

K. Revise data for “as-installed” condition.
1.07 PROTECTIVE DEVICE COORDINATION STUDY

A. General:

1. Prepare in accordance with IEEE 242.
2. Proposed protective device coordination time-current curves for distribution system, graphically displayed on conventional log-log curve sheets.
   a. Provide separate curve sheets for phase and ground fault coordination for each scenario.
   b. Each curve sheet to have title and one-line diagram that applies to specific portion of system associated with time-current curves on that sheet. Limit number of devices shown to four to six.
   c. Identify device associated with each curve by manufacturer type, function, and, if applicable, recommended tap, time delay, instantaneous and other settings recommended.
   d. Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which device is exposed.
   e. Apply motor protection methods that comply with NFPA 70.

B. Plot Characteristics on Curve Sheets:

1. Electric utility’s relays.
2. Electric utility’s fuses including manufacturer’s minimum melt, total clearing, tolerance, and damage bands.
3. Low-voltage fuses including manufacturer’s minimum melt, total clearing, tolerance, and damage bands.
4. Low-voltage equipment circuit breaker trip devices, including manufacturers tolerance bands.
5. Pertinent transformer full-load currents at 100 percent.
6. Transformer magnetizing inrush currents.
7. Transformer damage curves; appropriate for system operation and location.
8. ANSI transformer withstand parameters.
10. Motor overload relay settings for motors greater than 50 hp.
12. Other system load protective devices for largest branch circuit and feeder circuit breaker in each motor control center.
C. Primary Protective Device Settings for Delta-Wye Connected Transformer:

1. Secondary Line-to-Ground Fault Protection: Primary protective device operating band within transformer’s characteristics curve, including a point equal to 58 percent of IEEE C57.12.00 withstand point.

D. Tabulate Recommended Protective Device Settings:

1. Relays:
   a. Current tap.
   b. Time dial.
   c. Instantaneous pickup.
2. Circuit Breakers:
   a. Adjustable pickups.
   b. Adjustable time-current characteristics.
   c. Adjustable time delays.
   d. Adjustable instantaneous pickups.
   e. I^2t In/Out.
   f. Zone interlocking.
   g. Electronic settings data file.

E. Written Summary:

1. Scope of studies performed.
2. Summary of protective device coordination methodology.
3. Prevailing conditions.
4. Selected equipment deficiencies.
5. Results of coordination study.
6. Appendix of complete relay and circuit breaker electronic setting files, submit electronic data files from manufacturer’s software.
7. Comments or suggestions.

1.08 ARC FLASH STUDY

A. Perform arc flash hazard study after short circuit and protective device coordination study has been completed, reviewed and accepted.

B. Perform arc flash study in accordance with NFPA 70E, OSHA 29 CFR, Part 1910 Subpart S, and IEEE 1584.
C. Base Calculation:

1. For each major part of electrical power system, determine the following:
   a. Flash hazard protection boundary.
   b. Limited approach boundary.
   c. Restricted approach boundary.
   d. Incident energy level.
   e. Glove class required.

D. Produce arc flash warning labels that list items in Paragraph Base Calculation and the following additional items:

1. Bus name.
2. Bus voltage.

E. Produce bus detail sheets that list items in Paragraph Base Calculation and the following additional items:

1. Bus name.
2. Upstream protective device name, type, and settings.

F. Produce arc flash evaluation summary sheet listing the following additional items:

1. Bus name.
2. Upstream protective device name, type, settings.
5. Protective device bolted fault current.
6. Arcing fault current.
7. Protective device trip/delay time.
8. Breaker opening time.
9. Solidly grounded column.
10. Equipment type.

G. Analyze short circuit, protective device coordination, and arc flash calculations and highlight equipment that is determined to be underrated or causes incident energy values greater than 8 cal/cm². Propose approaches to reduce energy levels.
H. Prepare report summarizing arc flash study with conclusions and recommendations which may affect integrity of electric power distribution system. As a minimum, include the following:

1. Equipment manufacturer’s information used to prepare study.
2. Assumptions made during study.
3. Reduced copy of one-line drawing; 11 inches by 17 inches maximum.
4. Arc flash evaluations summary spreadsheet.
5. Bus detail sheets.
6. Arc flash warning labels printed in color on thermally bonded adhesive backed UV and weather-resistant labels.

PART 2 PRODUCTS

2.01 ARC FLASH WARNING LABELS

A. Arc flash warning labels printed in color on thermally bonded adhesive backed, UV- and weather-resistant labels.

PART 3 EXECUTION

3.01 GENERAL

A. Adjust relay and protective device settings according to values established by coordination study.
B. Make minor modifications to equipment as required to accomplish conformance with short circuit and protective device coordination studies.
C. Notify Engineer in writing of required major equipment modifications.
D. Provide laminated one-line diagrams (minimum size 11 inches by 17 inches) to post on interior of electrical room doors.
E. Provide arc flash warning labels on equipment as specified in this section.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   c. D924, Standard Test Method for Dissipation Factor (or Power Factor) and Relative Permittivity (Dielectric Constant) of Electrical Insulating Liquids.
   e. D974, Standard Test Method for Acid and Base Number by Color-Indicator Titration.

   b. 70B, Recommended Practice for Electrical Equipment Maintenance.
   c. 70E, Standard for Electrical Safety in the Workplace.

1.02 SUBMITTALS

A. Informational Submittals:

1. Submit 30 days prior to performing inspections or tests:
   a. Schedule for performing inspection and tests.
   b. List of references to be used for each test.
   c. Sample copy of equipment and materials inspection form(s).
   d. Sample copy of individual device test form.
   e. Sample copy of individual system test form.

2. Energization Plan:
   a. Prior to initial energization of electrical distribution equipment; include the following:
      1) Owner’s representative sign-off form for complete and accurate arc flash labeling and proper protective device settings for equipment to be energized.
      2) Staged sequence of initial energization of electrical equipment.
      3) Lock-Out-Tag-Out plan for each stage of the progressive energization.
      4) Barricading, signage, and communication plan notifying personnel of newly energized equipment.

3. Submit test or inspection reports and certificates for each electrical item tested within 15 days after completion of test.
4. Operation and Maintenance Data:
   a. In accordance with Section 01 78 23, Operation and Maintenance Data.
   b. After test or inspection reports and certificates have been reviewed by Engineer and returned, insert a copy of each in Operation and Maintenance Manual.

5. Programmable Settings:
   a. At completion of Performance Demonstration Test, submit final hardcopy printout and electronic files on compact disc of as-left setpoints, programs, and device configuration files for:
      1) Protective relays.
      2) Intelligent overload relays.
      3) Adjustable frequency drives.
      4) Power metering devices.
      5) Uninterruptible power supplies.
      6) Electrical communications modules.

1.03 QUALITY ASSURANCE

A. Testing Firm Qualifications:
   1. Corporately and financially independent organization functioning as an unbiased testing authority.
   2. Professionally independent of manufacturers, suppliers, and installers of electrical equipment and systems being tested.
   3. Employer of engineers and technicians regularly engaged in testing and inspecting of electrical equipment, installations, and systems.
   4. Supervising engineer accredited as Certified Electrical Test Technologist by NICET or NETA and having a minimum of 5 years’ testing experience on similar projects.
   5. Technicians certified by NICET or NETA.
   6. Assistants and apprentices assigned to Project at ratio not to exceed two certified to one noncertified assistant or apprentice.
   7. Registered Professional Engineer to provide comprehensive Project report outlining services performed, results of such services, recommendations, actions taken, and opinions.
   8. In compliance with OSHA CFR 29, Part 1910.7 criteria for accreditation of testing laboratories or a full member company of NETA.

B. Test equipment shall have an operating accuracy equal to or greater than requirements established by NETA ATS.

C. Test Instrument Calibration: In accordance with NETA ATS.
1.04 SEQUENCING AND SCHEDULING

A. Perform inspection and electrical tests after equipment listed herein has been installed.

B. Perform tests with apparatus de-energized whenever feasible.
   1. Scheduled with Engineer prior to de-energization.
   2. Minimized to avoid extended period of interruption to the operating plant equipment.

C. Notify Engineer at least 72 hours prior to performing tests on energized electrical equipment.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Perform tests in accordance with requirements of Section 01 91 14, Equipment Testing and Facility Startup.

B. Tests and inspections shall establish:
   1. Electrical equipment is operational within industry and manufacturer’s tolerances and standards.
   2. Installation operates properly.
   3. Equipment is suitable for energization.

C. Perform inspection and testing in accordance with NETA ATS, industry standards, and manufacturer’s recommendations.

D. Set, test, and calibrate protective relays, circuit breakers, fuses, power monitoring systems, and other applicable devices in accordance with values established by short circuit, coordination, and harmonics studies as specified in Section 26 05 70, Electrical Systems Analysis.

E. Adjust mechanisms and moving parts of equipment for free mechanical movement.

F. Adjust and set electromechanical electronic relays and sensors to correspond to operating conditions, or as recommended by manufacturer.
G. Verify nameplate data for conformance to Contract Documents and approved Submittals.

H. Realign equipment not properly aligned and correct unlevelness.

I. Properly anchor electrical equipment found to be inadequately anchored.

J. Tighten accessible bolted connections, including wiring connections, with calibrated torque wrench/screw driver to manufacturer’s recommendations, or as otherwise specified in NETA ATS.

K. Clean contaminated surfaces with cleaning solvents as recommended by manufacturer.

L. Provide proper lubrication of applicable moving parts.

M. Inform Engineer of working clearances not in accordance with NFPA 70.

N. Investigate and repair or replace:
   1. Electrical items that fail tests.
   2. Active components not operating in accordance with manufacturer’s instructions.
   3. Damaged electrical equipment.

O. Electrical Enclosures:
   1. Remove foreign material and moisture from enclosure interior.
   2. Vacuum and wipe clean enclosure interior.
   3. Remove corrosion found on metal surfaces.
   4. Repair or replace, as determined by Engineer, door and panel sections having dented surfaces.
   5. Repair or replace, as determined by Engineer, poor fitting doors and panel sections.
   6. Repair or replace improperly operating latching, locking, or interlocking devices.
   7. Replace missing or damaged hardware.
   8. Finish:
      a. Provide matching paint and touch up scratches and mars.
      b. If required because of extensive damage, as determined by Engineer refinish entire assembly.

P. Replace fuses and circuit breakers that do not conform to size and type required by the Contract Documents or approved Submittals.
3.02 CHECKOUT AND STARTUP

A. Voltage Field Test:

1. Check voltage at point of termination of power company supply system to Project when installation is essentially complete and is in operation.
2. Check voltage amplitude and balance between phases for loaded and unloaded conditions.
3. Record supply voltage (all three phases simultaneously on same graph) for 24 hours during normal working day.
   a. Submit Voltage Field Test Report within 5 days of test.
4. Unbalance Corrections:
   a. Make written request to power company to correct condition if balance (as defined by NEMA) exceeds 1 percent, or if voltage varies throughout the day and from loaded to unloaded condition more than plus or minus 4 percent of nominal.
   b. Obtain written certification from responsible power company official that voltage variations and unbalance are within their normal standards if corrections are not made.

B. Equipment Line Current Tests:

1. Check line current in each phase for each piece of equipment.
2. Make line current check after power company has made final adjustments to supply voltage magnitude or balance.
3. If phase current for a piece of equipment is above rated nameplate current, prepare Equipment Line Phase Current Report that identifies cause of problem and corrective action taken.

3.03 SWITCHBOARD ASSEMBLIES

A. Visual and Mechanical Inspection:

1. Insulator damage and contaminated surfaces.
2. Proper barrier and shutter installation and operation.
3. Proper operation of indicating devices.
4. Improper blockage of air-cooling passages.
5. Proper operation of drawout elements.
6. Integrity and contamination of bus insulation system.
7. Check door and device interlocking system by:
   a. Closure attempt of device when door is in OFF or OPEN position.
   b. Opening attempt of door when device is in ON or CLOSED position.
8. Check key interlocking systems for:
   a. Key captivity when device is in ON or CLOSED position.
   b. Key removal when device is in ON or CLOSED position.
c. Closure attempt of device when key has been removed.
d. Correct number of keys in relationship to number of lock cylinders.
e. Existence of Other Keys Capable of Operating Lock Cylinders:
   Destroy duplicate sets of keys.
9. Check nameplates for proper identification of:
   a. Equipment title and tag number with latest one-line diagram.
   b. Pushbutton.
   c. Control switch.
   d. Pilot light.
   e. Control relay.
   f. Circuit breaker.
   g. Indicating meter.
10. Verify fuse and circuit breaker ratings, sizes, and types conform to those specified.
11. Check bus and cable connections for high resistance by low resistance ohmmeter and calibrated torque wrench applied to bolted joints.
   a. Ohmic value to be zero.
   b. Bolt torque level in accordance with NETA ATS, Table 100.12,
      unless otherwise specified by manufacturer.
12. Check operation and sequencing of electrical and mechanical interlock systems by:
   a. Closure attempt for locked open devices.
   b. Opening attempt for locked closed devices.
   c. Key exchange to operate devices in OFF-NORMAL positions.
13. Verify performance of each control device and feature.
14. Control Wiring:
   a. Compare wiring to local and remote control and protective devices with elementary diagrams.
   b. Proper conductor lacing and bundling.
   c. Proper conductor identification.
   d. Proper conductor lugs and connections.
15. Exercise active components.
16. Perform phasing check on double-ended equipment to ensure proper bus phasing from each source.

B. Electrical Tests:

1. Insulation Resistance Tests:
   a. Applied megohmmeter dc voltage in accordance with NETA ATS, Table 100.1.
   b. Each phase of each bus section.
   c. Phase-to-phase and phase-to-ground for 1 minute.
   d. With breakers open.
   e. With breakers closed.
f. Control wiring except that connected to solid state components.
g. Insulation resistance values equal to, or greater than, ohmic values established by manufacturer.

2. Overpotential Tests:
   a. Applied ac voltage and test procedure in accordance with IEEE C37.20.1. Alternatively use NETA ATS, Table 100.2.
   b. Each phase of each bus section.
   c. Phase-to-phase and phase-to-ground for 1 minute.
   d. Test results evaluated on a pass/fail basis.

3. Current Injection Tests:
   a. For entire current circuit in each section.
   b. Secondary injection for current flow of 1 ampere.
   c. Test current at each device.

4. Control Wiring:
   a. Apply secondary voltage to control power and potential circuits.
   b. Check voltage levels at each point on terminal boards and each device terminal.

5. Operational Test:
   a. Initiate control devices.
   b. Check proper operation of control system in each section.

3.04 PANELBOARDS

A. Visual and Mechanical Inspection: Include the following inspections and related work:

1. Inspect for defects and physical damage, labeling, and nameplate compliance with requirements of up-to-date drawings and panelboard schedules.
2. Exercise and perform operational tests of mechanical components and other operable devices in accordance with manufacturer’s instruction manual.
3. Check panelboard mounting, area clearances, and alignment and fit of components.
4. Check tightness of bolted electrical connections with calibrated torque wrench. Refer to manufacturer’s instructions for proper torque values.
5. Perform visual and mechanical inspection for overcurrent protective devices.
B. Electrical Tests: Include the following items performed in accordance with manufacturer’s instruction:

1. Insulation Resistance Tests:
   a. Applied megohmmeter dc voltage in accordance with NETA ATS, Table 100.1.
   b. Each phase of each bus section.
   c. Phase-to-phase and phase-to-ground for 1 minute.
   d. With breakers open.
   e. With breakers closed.
   f. Control wiring except that connected to solid state components.
   g. Insulation resistance values equal to, or greater than, ohmic values established by manufacturer.

2. Ground continuity test ground bus to system ground.

3.05 DRY TYPE TRANSFORMERS

A. Visual and Mechanical Inspection:

1. Physical and insulator damage.
2. Proper winding connections.
3. Bolt torque level in accordance with NETA ATS, Table 100.12, unless otherwise specified by manufacturer.
4. Defective wiring.
5. Proper operation of fans, indicators, and auxiliary devices.
6. Removal of shipping brackets, fixtures, or bracing.
7. Free and properly installed resilient mounts.
8. Cleanliness and improper blockage of ventilation passages.
9. Verify tap-changer is set at correct ratio for rated output voltage under normal operating conditions.
10. Verify proper secondary voltage phase-to-phase and phase-to-ground after energization and prior to loading.

B. Electrical Tests:

1. Insulation Resistance Tests:
   a. Applied megohmmeter dc voltage in accordance with NETA ATS, Table 100.5 for each:
      1) Winding-to-winding.
      2) Winding-to-ground.
   b. Test Duration: 10 minutes with resistances tabulated at 30 seconds, 1 minute, and 10 minutes.
   c. Results temperature corrected in accordance with NETA ATS, Table 100.14.
d. Temperature corrected insulation resistance values equal to, or
greater than, ohmic values established by manufacturer.
e. Insulation resistance test results to compare within 1 percent of
adjacent windings.

2. Perform tests and adjustments for fans, controls, and alarm functions as
suggested by manufacturer.

3.06 LOW VOLTAGE CABLES, 600 VOLTS MAXIMUM

A. Visual and Mechanical Inspection:

1. Inspect each individual exposed power cable No. 6 AWG and larger for:
   a. Physical damage.
   b. Proper connections in accordance with single-line diagram.
   c. Cable bends not in conformance with manufacturer’s minimum
      allowable bending radius where applicable.
   d. Color coding conformance with specification.
   e. Proper circuit identification.

2. Mechanical Connections for:
   a. Proper lug type for conductor material.
   b. Proper lug installation.
   c. Bolt torque level in accordance with NETA ATS, Table 100.12,
      unless otherwise specified by manufacturer.

3. Shielded Instrumentation Cables for:
   a. Proper shield grounding.
   b. Proper terminations.
   c. Proper circuit identification.

4. Control Cables for:
   a. Proper termination.
   b. Proper circuit identification.

5. Cables Terminated Through Window Type CTs: Verify neutrals and
   grounds are terminated for correct operation of protective devices.

B. Electrical Tests for Conductors No. 6 AWG and Larger:

1. Insulation Resistance Tests:
   a. Utilize 1,000V dc megohmmeter for 600-volt insulated
      conductors.
   b. Test each conductor with respect to ground and to adjacent
      conductors for 1 minute.
   c. Evaluate ohmic values by comparison with conductors of same
      length and type.
   d. Investigate values less than 50 megohms.

2. Continuity test by ohmmeter method to ensure proper cable
   connections.
C. Low-voltage cable tests may be performed by installer in lieu of independent testing firm.

3.07 SAFETY SWITCHES, 600 VOLTS MAXIMUM

A. Visual and Mechanical Inspection:

1. Proper blade pressure and alignment.
2. Proper operation of switch operating handle.
3. Adequate mechanical support for each fuse.
4. Proper contact-to-contact tightness between fuse clip and fuse.
5. Cable connection bolt torque level in accordance with NETA ATS, Table 100.12.
6. Proper phase barrier material and installation.
7. Verify fuse sizes and types correspond to one-line diagram or approved Submittals.
8. Perform mechanical operational test and verify electrical and mechanical interlocking system operation and sequencing.

B. Electrical Tests:

1. Insulation Resistance Tests:
   a. Applied megohmmeter dc voltage in accordance with NETA ATS, Table 100.1.
   b. Phase-to-phase and phase-to-ground for 1 minute on each pole.
   c. Insulation resistance values equal to, or greater than, ohmic values established by manufacturer.
2. Contact Resistance Tests:
   a. Contact resistance in microhms across each switch blade and fuse holder.
   b. Investigate deviation of 50 percent or more from adjacent poles or similar switches.

3.08 MOLDED AND INSULATED CASE CIRCUIT BREAKERS

A. General: Inspection and testing limited to circuit breakers rated 70 amperes and larger and to motor circuit protector breakers rated 50 amperes and larger.

B. Visual and Mechanical Inspection:

1. Proper mounting.
2. Proper conductor size.
3. Feeder designation according to nameplate and one-line diagram.
4. Cracked casings.
5. Connection bolt torque level in accordance with NETA ATS, Table 100.12.
6. Operate breaker to verify smooth operation.
7. Compare frame size and trip setting with circuit breaker schedules or one-line diagram.
8. Verify that terminals are suitable for 75 degrees C rated insulated conductors.

C. Electrical Tests:

1. Insulation Resistance Tests:
   a. Utilize 1,000V dc megohmmeter for 480-volt and 600-volt circuit breakers and 500V dc megohmmeter for 240-volt circuit breakers.
   b. Pole-to-pole and pole-to-ground with breaker contacts opened for 1 minute.
   c. Pole-to-pole and pole-to-ground with breaker contacts closed for 1 minute.
   d. Test values to comply with NETA ATS, Table 100.1.

2. Contact Resistance Tests:
   a. Contact resistance in microhms across each pole.
   b. Investigate deviation of 50 percent or more from adjacent poles and similar breakers.

3. Primary Current Injection Test to Verify:
   a. Long-time minimum pickup and delay.
   b. Short-time pickup and delay.
   c. Ground fault pickup and delay.
   d. Instantaneous pickup by run-up or pulse method.
   e. Trip characteristics of adjustable trip breakers shall be within manufacturer’s published time-current characteristic tolerance band, including adjustment factors.
   f. Trip times shall be within limits established by NEMA AB 4, Table 5-3. Alternatively, use NETA ATS, Table 100.7.
   g. Instantaneous pickup value shall be within values established by NEMA AB 4, Table 5-4. Alternatively, use NETA ATS, Table 100.8.

3.09 LOW-VOLTAGE POWER CIRCUIT BREAKERS

A. Visual and Mechanical Inspection:

1. Proper mounting, cell fit, and element alignment.
2. Proper operation of racking interlocks.
3. Check for damaged arc chutes.
4. Proper contact condition.
5. Bolt torque level in accordance with NETA ATS, Table 100.12.
6. Perform mechanical operational and contact alignment tests in accordance with manufacturer’s instructions.
7. Check operation of closing and tripping functions of trip devices by activating ground fault relays, undervoltage shunt relays, and other auxiliary protective devices.
8. Verify primary and secondary contact wipe, gap setting, and other dimensions vital to breaker operation are correct.
9. Check charging motor, motor brushes, associated mechanism, and limit switches for proper operation and condition.
10. Check operation of electrically operated breakers in accordance with manufacturer’s instructions.
11. Check for adequate lubrication on contact, moving, and sliding surfaces.

B. Electrical Tests:

1. Insulation Resistance Tests:
   a. Utilize 1,000V dc megohmmeter for 480-volt and 600-volt circuit breakers.
   b. Pole-to-pole and pole-to-ground with breaker contacts opened for 1 minute.
   c. Pole-to-pole and pole-to-ground with breaker contacts closed for 1 minute.
   d. Test values to comply with NETA ATS, Table 100.1.
2. Contact Resistance Tests:
   a. Contact resistance in microhms across each pole.
   b. Investigate deviation of 50 percent or more from adjacent poles and similar breakers.
3. Primary Current Injection Test to Verify:
   a. Long-time minimum pickup and delay.
   b. Short-time pickup and delay.
   c. Ground fault pickup and delay.
   d. Instantaneous pickup by run-up or pulse method.
   e. Trip characteristic when adjusted to setting sheet parameters shall be within manufacturer’s published time-current tolerance band.

3.10 METERING

A. Visual and Mechanical Inspection:

1. Verify meter connections in accordance with appropriate diagrams.
2. Verify meter multipliers.
3. Verify meter types and scales conform to Contract Documents.
4. Check calibration of meters at cardinal points.
5. Check calibration of electrical transducers.
3.11 GROUNDING SYSTEMS

A. Visual and Mechanical Inspection:
   1. Equipment and circuit grounds in motor control center, panelboard, and switchboard assemblies for proper connection and tightness.
   2. Ground bus connections in motor control center, panelboard, and switchboard assemblies for proper termination and tightness.
   3. Effective transformer core and equipment grounding.
   4. Accessible connections to grounding electrodes for proper fit and tightness.
   5. Accessible exothermic-weld grounding connections to verify that molds were fully filled and proper bonding was obtained.

B. Electrical Tests:
   1. Clamp-On Ground Meter Test:
      a. In accordance with manufacturer’s testing requirements.
      b. Performed on grounding electrode conductor of service-entrance equipment.
      c. Ground electrode system resistance to not exceed 5 ohms to remote earth.

3.12 AC INDUCTION MOTORS

A. General: Inspection and testing limited to motors rated 5 hp and larger.

B. Visual and Mechanical Inspection:
   1. Proper electrical and grounding connections.
   2. Shaft alignment.
   4. Operate motor and check for:
      a. Excessive mechanical and electrical noise.
      b. Overheating.
      c. Correct rotation.
      d. Check vibration detectors, resistance temperature detectors, or motor inherent protectors for functionability and proper operation.
      e. Excessive vibration, in excess of values in NETA ATS, Table 100.10.
   5. Check operation of space heaters.
C. Electrical Tests:

1. Insulation Resistance Tests:
   a. In accordance with IEEE 43 at test voltages established by NETA ATS, Table 100.1 for:
      1) Motors above 200 hp for 10-minute duration with resistances tabulated at 30 seconds, 1 minute, and 10 minutes.
      2) Motors 200 hp and less for 1-minute duration with resistances tabulated at 30 seconds and 60 seconds.
   b. Insulation resistance values equal to, or greater than, ohmic values established by manufacturers.

2. Calculate polarization index ratios for motors above 200 hp. Investigate index ratios less than 1.5 for Class A insulation and 2.0 for Class B insulation.

3. Insulation resistance test on insulated bearings in accordance with manufacturer’s instructions.

4. Measure running current and voltage, and evaluate relative to load conditions and nameplate full-load amperes.

END OF SECTION
SECTION 26 09 13
POWER MEASUREMENT AND CONTROL

PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

2. National Electrical Manufacturers Association (NEMA):
   b. 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).

1.02 DEFINITIONS

A. CT: Current Transformer.
C. LCD: Liquid Crystal Display.
D. LED: Light Emitting Diode.
E. MPR: Motor Protection Relay.
F. PLC: Programmable Logic Controller.
G. PT: Potential Transformer.
H. RTD: Resistance Temperature Detectors.
I. UCA: Utility Communications Architecture.

1.03 SUBMITTALS

A. Action Submittals:

1. Instruction manuals for each type of device.
2. Special features, licensed programming software.
3. Potential and current schematic diagrams.
4. Control and metering schematic diagrams.
5. Interconnection wiring diagrams.
6. Installation and mounting requirements.
7. Complete descriptive literature and renewal parts data.
B. Informational Submittals:

1. Programming software used to configure devices, along with settings files necessary to reload or revise settings as left by Contractor.
2. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.

PART 2 PRODUCTS

2.01 POWER METER (PM)

A. General:

1. Solid state device with LED displays.
2. Direct voltage input up to 600V ac.
3. Current input via current transformer with 5-ampere secondary.
4. Programmable current and potential transformer ratios.
5. Programmable limits to activate up to four alarms.
6. Selectable Voltage Measurements: Line-to-line or line-to-neutral and wye or delta.
7. Ethernet capable.

B. Simultaneous Display:

1. Volts, three-phase.
2. Amperes, three-phase.
4. Kilowatt hours.
5. Ethernet/IP communications network capable.
6. Frequency.
7. kW Demand with programmable period intervals.
8. kVA.
9. kVAR.
10. kVARh.
11. Manufacturers: Same as power distribution equipment supplied specified under other Sections of these Specifications.

2.02 INSTRUMENT TRANSFORMERS

A. Current Transformer (CT), 600 Volts and Below:

1. Type: Molded bar or donut.
2. Accuracy: 0.6 percent for metering.
3. Shorting type terminal boards for current transformer leads.
B. Potential Transformer (PT), 600 Volts and Below:
   1. Type: Molded.
   2. Accuracy Classification: 0.3 at burden imposed by meters and instruments, including future.

PART 3 EXECUTION

3.01 INSTALLATION

   A. In accordance with manufacturer’s written instructions.
   B. As defined in Section 26 08 00, Commissioning of Electrical Systems.

3.02 MANUFACTURER’S SERVICES

   A. See Section 01 43 33, Manufacturers’ Field Services, and Section 01 91 14, Equipment Testing and Facility Startup.

END OF SECTION
PART 1  GENERAL

1.01  SUMMARY

A.  Section includes a networked lighting control system comprised of the following components:
   
   2.  System Backbone and Integration Equipment: System Controller.
   3.  Wired Networked Devices:
      a.  Occupancy and Photocell Sensors.
      b.  Power Packs and Secondary Packs.
      c.  Relay and Dimming Panel.
      d.  Communication Bridge.

B.  The networked lighting control system shall meet all the characteristics and performance requirements specified herein.

C.  The Contractor shall provide, install and verify proper operation of all equipment necessary for proper operation of the system as specified herein and as shown on Drawings.

1.02  RELATED DOCUMENTS

A.  Section 26 27 26, Wiring Devices.

B.  Section 26 56 00, Exterior Lighting.

1.03  SUBMITTALS

A.  Submittal shall be provided including the following items.

   1.  Bill of Materials necessary to install the networked lighting control system.
   2.  Product Specification Sheets indicating general device descriptions, dimensions, electrical specifications, wiring details, and nomenclature.
   3.  Riser Diagrams showing device wiring connections of system backbone and typical per room/area type.
   4.  Information Technology (IT) connection information pertaining to interconnection with facility IT networking equipment and third-party systems.
   5.  Other Diagrams and Operational Descriptions: As needed to indicate system operation or interaction with other system(s).
ZINK DAM IMPROVEMENTS

6. Contractor Startup/Commissioning Worksheet (must be completed prior to factory start-up).
7. Service Specification Sheets indicating general service descriptions, including startup, training, post-startup support, and service contract terms.
8. Hardware and Software Operation Manuals.

1.04 APPROVALS

A. Prior approval from Owner’s representative is required for products or systems manufactured by companies not specified in the Network Lighting Controls section of this specification.

B. Any alternate product or system that has not received prior approval from the Owner’s representative at least 10 days prior to submission of a proposal package shall be rejected.

C. Alternate products or systems require submission of catalog datasheets, system overview documents and installation manuals to Owner’s representative.

D. For any alternate system that does not support any form of wireless communication to networked luminaires, networked control devices, networked sensors, or networked input devices, bidders shall provide a total installed cost including itemized labor costs for installing network wiring to luminaires, control devices, sensors, input devices and other required system peripherals.

1.05 QUALITY ASSURANCE

A. Product Qualifications:
   1. System electrical components shall be listed or recognized by a nationally recognized testing laboratory (e.g., UL, ETL, or CSA) and shall be labeled with required markings as applicable.
   2. System shall be listed as qualified under DesignLights Consortium Networked Lighting Control System Specification V2.0.
   3. System luminaires and controls are certified by manufacturer to have been designed, manufactured and tested for interoperability.
   4. All components shall be subjected to 100 percent end of line testing prior to shipment to the project site to ensure proper device operation.
   5. All components and the manufacturing facility where product was manufactured must be RoHS compliant.

B. Installation and Startup Qualifications: System startup shall be performed by qualified personnel approved or certified by the manufacturer.
C. Service and Support Requirements:
   1. Phone Support: Toll free technical support shall be available.
   2. Remote Support: The bidder shall offer a remote support capability.
   3. Onsite Support: The bidder shall offer onsite support that is billable at whole day rates.
   4. Service Contract: The bidder shall offer a Service Contract that packages phone, remote, and onsite support calls for the project. Response times for each type of support call shall be indicated in the terms of the service contract included in the bid package.

1.06 PROJECT CONDITIONS

A. Only install indoor equipment after the following site conditions are maintained:
   1. Ambient Temperature: 14 degrees F to 105 degrees F (minus 10 degrees C to 40 degrees C).
   2. Relative Humidity: Less than 90 percent noncondensing.

B. Equipment shall not be subjected to dust, debris, moisture, or temperature and humidity conditions exceeding the requirements indicated above or as marked on the product, at any point prior to installation.

C. Only properly rated equipment and enclosures, installed per the manufacturer’s instructions, may be subjected to dust and moisture following installation.

1.07 WARRANTY

A. The manufacturer shall provide a minimum five-year warranty on all hardware devices supplied and installed. Warranty coverage shall begin on the date of substantial completion.

B. The hardware warranty shall cover repair or replacement any defective products within the warranty period.

1.08 MAINTENANCE AND SUSTAINABILITY

A. The manufacturer shall make available to the Owner new parts, upgrades, and/or replacements available for a minimum of 5 years following installation.
1.09 SPARES

A. As part of this Contract, the installing Contractor shall furnish and provide the following spare material components:

1. Relays: Single-pole mechanically held, one for every 10 installed. Furnish at least one.
2. Dimmer Modules: one for every 10 of each type and rating installed. Furnish at least one.
3. Non-Dim Modules: One for every 10 of each type and rating installed. Furnish at least one.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Acceptable Manufacturers:

1. Acuity Brands Lighting, Inc.
2. Crestron Electronics, Inc.
3. Cooper Controls.

B. Basis of Design System: Acuity Controls nLight.

2.02 SYSTEM COMPLIANCE

A. System components shall comply with UL 916 and UL 924 standards where applicable.

B. System components shall comply with CFR Title 47, Part 15 standards where applicable.

C. System components shall comply with ISED Canada RSS-247 standards where applicable.

D. All equipment shall be installed and connected in compliance with NFPA 70.

2.03 SYSTEM PERFORMANCE REQUIREMENTS

A. System Architecture:

1. System shall have an architecture that is based upon three main concepts: (1) networkable intelligent lighting control devices, (2) standalone lighting control zones using distributed intelligence, (3) optional system backbone for remote, time based and global operation.
2. Intelligent lighting control devices shall have individually addressable network communication capability and consist of one or more basic lighting control components: occupancy sensor, photocell sensor, relay, dimming output, contact closure input, analog 0V to 10V input, and manual wall station capable of indicating switching, dimming, and/or scene control. Combining one or more of these components into a single device enclosure shall be permissible so as to minimize overall device count of system.

3. System must be capable of interfacing directly with networked luminaires such that either low voltage network cabling or wireless RF communication is used to interconnect networked luminaires with control components such as sensors, switches and system backbone (see Control Zone Characteristics sections for each type of network connection, wired or wireless).

4. Networked luminaires and intelligent lighting control devices shall support individual (unique) configuration of device settings and properties, with such configuration residing within the networked luminaires and intelligent control devices.

5. Lighting control zones consisting of one or more networked luminaires and intelligent lighting control devices and shall be capable of providing automatic control from sensors (occupancy and/or photocell) and manual control from local wall stations without requiring connection to a higher-level system backbone; this capability is referred to as “distributed intelligence.”

6. Lighting control zones (wired and wireless) of at least 128 devices per zone shall be supported.

7. Networked luminaires and intelligent lighting control devices shall have distributed intelligence programming stored in non-volatile memory, such that following any loss of power the lighting control zones shall operate according to their defined default settings and sequence of operations.

8. Lighting control zones shall be capable of being networked with a higher-level system backbone to provide time based control, remote control from inputs and/or systems external to the control zone, and remote configuration and monitoring through a software interface.

9. The system may include one or more system controllers that provide time-based control. The system controller also provides a means of connecting the lighting control system to a system software interface and building management systems via BACnet/IP or BACnet MS/TP protocol.

10. All system devices shall support firmware update, either remotely or from within the applications space, for purposes of upgrading functionality at a later date.
B. Wired Networked Control Zone Characteristics:

1. Connections to devices within a wired networked lighting control zone and to backbone components shall be with a single type of low voltage network cable, which shall be compliant with CAT5e specifications or higher. To prevent wiring errors and provide cost savings, the use of mixed types of low voltage network cables shall not be permitted.

2. Devices in an area shall be connected via a “daisy-chain” topology; requiring all individual networked devices to be connected back to a central component in a “hub-and-spoke” topology shall not be permitted, so as to reduce the total amount of network cable required for each control zone.

3. System shall provide the option of having pre-terminated plenum rated low voltage network cabling supplied with hardware so as to reduce the opportunity for improper wiring and communication errors during system installation.

4. Following proper installation and provision of power, all networked devices connected together with low voltage network cable shall automatically form a functional lighting control zone without requiring any type of programming, regardless of the programming mechanism (e.g. software application, handheld remote, pushbutton). The “out of box” default sequence of operation is intended to provide typical sequence of operation so as to minimize the system startup and programming requirements and to also have functional lighting control operation prior to system startup and programming.

5. Once software is installed, system shall be able to automatically discover all connected devices without requiring any provisioning of system or zone addresses.

6. All networked devices shall have the ability to detect improper communication wiring and blink its LED in a specific cadence as to alert installation/startup personnel.

7. Networked control devices intended for control of egress and/or emergency light sources shall not require the use of additional, externally mounted UL 924 shunting and/or 0V to 10V disconnect devices, so as to provide a compliant sequence of operation while reducing the overall installation and wiring costs of the system. The following types of wired networked control devices shall be provided for egress and/or emergency light fixtures:
   a. Low-Voltage power sensing: These devices shall automatically provide 100 percent light level upon detection of loss of power sensed via the low voltage network cable connection.
   b. UL 924 Listed Line-Voltage power sensing: These devices shall be listed as emergency relays under the UL 924 standard, and shall automatically close the load control relay and provide
100 percent light output upon detection of loss of power sensed via line voltage connection to normal power.

8. **Networked luminaires and intelligent lighting control devices located in different areas shall be able to transmit and track information within at least 128 system-wide control zones to support required sequences of operation that may span across multiple areas. Occupancy and photocell commands shall be available across a single controller, and switch commands shall be available across single or multiple controllers. These shall also be referred to as global control zones.**

9. **Wired networked wall stations shall provide the following Scene Control Capabilities:**
   - **a.** Preset Scenes that can activate a specific combination of light levels across multiple local and global channels, as required.
   - **b.** Profile Scenes that can modify the sequence of operation for the devices in the area (group) in response to a button press. This capability is defined as supporting “Local Profiles” and is used to dynamically optimize the occupant experience and lighting energy usage. Wall stations shall be able to manually start and stop Local Profiles, or the local profile shall be capable of ending after a specific duration of time between 5 minutes and 12 hours. Parameters that shall be configurable and assigned to a Local Profile shall include, but not be limited to, fixture light level, occupancy time delay, response to occupancy sensors (including enabling/disabling response), response to daylight sensors (including enabling/disabling response), and enabling/disabling of wall stations.
   - **c.** Three-way / multi-way control: multiple wall stations shall be capable of controlling the same local and global control zones, so as to support “multi-way” preset scene and profile scene control.

C. **System Integration Capabilities:**

1. The system shall interface with third party building management systems (BMS) to support two-way communication using the industry standard BACnet/IP or BACnet MS/TP protocols. The following system integration capabilities shall be available via BACnet/IP and BACnet MS/TP protocols:
   - **a.** The system shall support control of individual devices, including, but not limited to, control of relay and dimming output.
   - **b.** The system shall support reading of individual device status information. The available status will depend on the individual device type and capabilities, which may include but not be limited to, relay state, dimming output, power measurement, occupancy sensor status, and photocell sensor states or readings. All system devices shall be available for polling for devices status.
c. The system shall support activation of pre-defined system Global Profiles (see Supported Sequence of Operations for further definition of Global Profile capabilities).

2. The system shall support activation of Global Profiles from third party systems by receiving dry contact closure output signals or digital commands via RS-232/RS-485. (See Supported Sequence of Operations for further definition of Profile and Scene Preset capabilities.)

3. The system shall support activation of demand response levels from Demand Response Automation Servers (DRAS) via the OpenADR 2.0a protocol.

D. Supported Sequence of Operations:

1. Control Zones: Networked luminaires and intelligent lighting control devices installed in an area (also referred to as a group of devices) shall be capable of transmitting and tracking occupancy sensor, photocell sensor, and manual switch information within at least 48 unique control zones to support different and reconfigurable sequences of operation within the area. These shall also be referred to as local control zones.

2. Wall Station Capabilities:
   a. Wall stations shall be provided to support the following capabilities:
      1) ON/OFF of a local control zone.
      2) Continuous dimming control of light level of a local control zone.
   b. Three-way / multi-way control: multiple wall stations shall be capable of controlling the same local control zones, so as to support “multi-way” switching and/or dimming control.

3. Occupancy Sensing Capabilities:
   a. Occupancy sensors shall be configurable to control a local zone.
   b. Multiple occupancy sensors shall be capable of controlling the same local zones. This capability combines occupancy sensing coverage from multiple sensors without consuming multiple control zones.
   c. System shall support the following types of occupancy sensing sequence of operations:
      1) ON/OFF Occupancy Sensing.
      2) Partial-ON Occupancy Sensing.
      3) Partial-OFF Occupancy Sensing.
      4) Vacancy Sensing (Manual ON / Automatic OFF).
   d. ON/OFF, Partial-ON, and Partial-OFF Occupancy Sensing modes shall function according to the following sequence of operation:
      1) Occupancy sensors shall automatically turn lights on to a designated level when occupancy is detected. To support
fine tuning of Partial-ON sequences the designated occupied light level shall support at least 100 dimming levels.

2) Occupancy sensors shall automatically turn lights off or to a dimmed state (Partial-OFF) when vacancy occurs or if sufficient daylight is detected. To support fine tuning of Partial-OFF sequences the designated unoccupied dim level shall support at least 100 dimming levels.

3) To provide additional energy savings the system shall also be capable of combining Partial-OFF and Full-OFF operation by dimming the lights to a designated level when vacant and then turning the lights off completely after an additional amount of time.

4) Photocell readings, if enabled in the Occupancy Sensing control zone, shall be capable of automatically adjusting the light level during occupied or unoccupied conditions as necessary to further reduce energy usage. Additional requirements and details for photocell sensing capabilities are indicated under Photocell Sensing Capabilities.

5) The use of a wall station shall change the dimming level or turn lights off as selected by the occupant. The lights shall optionally remain in this manually-specified light level until the zone becomes vacant; upon vacancy the normal sequence of operation, as defined above, shall proceed.

e. Vacancy Sensing mode (also referred to as Manual-ON / Automatic-OFF) shall function according to the following sequence of operation:

1) The use of a wall station is required turn lights on. The system shall be capable of programming the zone to turn on to either to a designated light level or the previous user light level. Initially occupying the space without using a wall station shall not result in lights turning on.

2) Occupancy sensors shall automatically turn lights off or to a dimmed state (Partial-OFF) when vacancy occurs or if sufficient daylight is detected. To support fine tuning of Partial-Off sequences the designated unoccupied dim level shall support at least 100 dimming levels.

3) To provide additional energy savings and an enhanced occupant experience, the system shall also be capable of dimming the lights when vacant and then turning the lights off completely after an additional amount of time.

4) To minimize occupant impact in case the area or zone is still physically occupied following dimming or shutoff of the lights due to detection of vacancy, the system shall support an “automatic grace period” immediately following detection of vacancy, during which time any detected
occupancy shall result in the lights reverting to the previous level. After the grace period has expired, the use of a wall station is required to turn lights on.

5) Photocell readings, if enabled in the Occupancy Sensing control zone, shall be capable of automatically adjusting the light level during occupied or unoccupied conditions as necessary to further reduce energy usage. Additional requirements and details for photocell sensing capabilities are indicated under Photocell Sensing Capabilities.

6) At any time, the use of a wall station shall change the dimming level or turn lights off as selected by the occupant. The lights shall optionally remain in this manually-specified light level until the zone becomes vacant; upon vacancy the normal sequence of operation, as defined above, shall proceed.

f. To accommodate diverse types of environments, occupancy time delays before dimming or shutting off lights shall be specifiable for control zones between 15 seconds to 2 hours.

4. Photocell Sensing Capabilities (Automatic Daylight Sensing):
   a. Photocell sensing devices shall be configurable to control a local zone.
   b. The system shall support the following type of photocell-based control:
      1) Continuous Dimming: The control zone automatically adjusts its dimming output in response to photocell readings, such that a minimum light level consisting of both electric light and daylight sources is maintained at the task. The photocell response shall be configurable to adjust the photocell setpoint and dimming rates.

5. Schedule and Global Profile Capabilities:
   a. The system shall be capable of automatically modifying the sequence of operation for selected devices in response to any of the following: a time-of-day schedule, contact closure input state, manually triggered wired wall station input, RS-232/RS-485 command to wired input device, and BACnet input command. This capability is defined as supporting “Global Profiles” and is used to dynamically optimize the occupant experience and lighting energy usage.
   b. Global profiles may be scheduled with the following capabilities:
      1) Global Profiles shall be stored within and executed from the system controller (via internal timeclock) such that a dedicated software host or server is not required to be online to support automatic scheduling and/or operation of Global Profiles.
2) Global Profile time of day schedules shall be capable of being given the following recurrence settings: daily, specific days of week, every “n” number of days, weekly, monthly, and yearly. Lighting control profile schedules shall support definition of start date, end date, end after “n” recurrences, or never ending. Daylight savings time adjustments shall be capable of being performed automatically, if desired.

3) Global Profile Holiday Schedules should follow recurrent settings for specific US holiday dates regardless if they always occur on a specific date or are determined by the day/week of the month.

4) Global Profiles shall be capable of being scheduled to run according to timed offsets relative to sunrise or sunset. Sunrise/sunset times shall be automatically derived from location information using an astronomical clock.

5) System shall support blink warning and timed extension capabilities. At the end of a scheduled period, the system shall be capable of providing a visible “blink warning” 5 minutes prior to the end of the schedule. Wall stations may be programmed to provide timed overrides that turn the lights on for an additional period of time. Timed override duration shall be programmable for each individual device, zone of devices, or customized group of devices, ranging from 5 minutes to 12 hours.

6) Software management interface shall be capable of displaying a graphic calendar view of profile schedules for each control zone.

c. System Global Profiles shall have the following additional capabilities:

1) Global Profiles shall be capable of being manually activated directly from the system controller, specially programmed wired input devices, scene capable wired wall stations, and the software management interface.

2) Global Profiles shall be selectable to apply to a single device, zone of devices, or customized group of devices.

3) Parameters that shall be configurable and assigned to a Global Profile shall include, but not be limited to, fixture light level, occupancy time delay, response to occupancy sensors (including enabling/disabling response), response to daylight sensors (including enabling/disabling response), and enabling/disabling of wall stations.

d. A backup of Local and Global Profiles shall be stored on the software’s host server such that the Profile backup can be applied to a replacement system controller or wired wall station.
6. System shall support automated demand response capabilities with automatic reduction of light level to at least three levels of demand response.

2.04 SYSTEM SOFTWARE INTERFACES

A. Management Interface:

1. System shall provide a web-based management interface that provides remote system control, live status monitoring, and configuration capabilities of lighting control settings and schedules.

2. Management interface must be compatible with industry-standard web browser clients, including, but not limited to, Microsoft Internet Explorer®, Apple Safari®, Google Chrome®, Mozilla Firefox®.

3. Management interface shall require all users to login with a User Name and Password, and shall support creation of at least 100 unique user accounts.

4. Management interface shall support at least three permission levels for users: read-only, read and change settings, and full administrative system access.

5. Management interface shall be capable of restricting access for user accounts to specific devices within the system.

6. All system devices shall be capable of being given user-defined names.

7. The following device identification information shall be displayed in the Management interface: model number, model description, serial number or network ID, manufacturing date code, custom label(s), and parent network device.

8. Management interface shall be able to read the live status of a networked luminaire or intelligent control device and shall be capable of displaying luminaire on/off status, dim level, power measurement, device temperature, PIR occupancy sensor status, microphonic occupancy sensor status, remaining occupancy time delay, photocell reading, and active Profiles.

9. Management interface shall be able to read the current active settings of a networked luminaire or intelligent control device and shall be capable of displaying dimming trim levels, occupancy sensor and photocell enable/disable, occupancy sensor time delay and light level settings, occupancy sensor response (normal or vacancy), and photocell setpoints and transition time delays.

10. Management interface shall be able to change the current active settings and default settings for an individual networked luminaire or intelligent control device.

11. Management interface shall be capable of applying settings changes for a zone of devices or a group of selected devices using a single “save”
action that does not require the user to save settings changes for each individual device.

12. A printable network inventory report shall be available via the management interface.

13. A printable report detailing all system profiles shall be available via the management interface.

14. All sensitive information stored by the software shall be encrypted.

15. All system software updates must be available for automatic download and installation via the internet.

2.05 SYSTEM BACKBONE AND SYSTEM INTEGRATION EQUIPMENT

A. System Controller:

1. System Controller shall be multi-tasking, real-time digital control processor consisting of modular hardware with plug-in enclosed processors, communication controllers, and power supplies.

2. System Controller shall have 32-bit microprocessor operating at a minimum of 1 GHz.

3. System Controller shall have minimum of 512 MB memory, with a minimum of 4 GB nonvolatile flash, to support its own operating system and databases.

4. System Controller shall perform the following functions:
   a. Time-based control of downstream wired and wireless network devices.
   b. Linking into an Ethernet network.
   c. Integration with Building Management Systems (BMS) and Heating, Ventilation and Air Conditioning (HVAC) equipment.
   d. Connection to various software interfaces, including management interface, historical database and analytics interface, and visualization interface.

5. System Controller shall have an integral web server to support configuration, diagnostics and hosting of software interfaces.

6. Device shall have option for a graphical touch screen to support configuration and diagnostics.

7. Device shall have three RJ-45 networked lighting control ports for connection to any of the following:
   a. The graphical touch screen.
   b. Wired communication bridges.
   c. Direct connection to networked wired luminaires and intelligent lighting control devices (up to 128 total devices per port).

8. Device shall automatically detect all networked devices connected to it.

9. Device shall have an internal time clock used for astronomical and standard schedules.
10. Device shall have 2 switched RJ-45 10/100 BaseT Ethernet ports for local area network (LAN) connection.
   a. Ethernet connection shall support daisy chain wiring to other lighting control system LAN devices.
   b. Ethernet connection shall support IPv4 and shall be capable of using a dedicated static or DHCP assigned IP address.

11. Device shall have 2 x USB 2.0 Expansion ports for 802.11 Wi-Fi Adapter enabling wireless connectivity including:
   a. Hot Spot.
   b. Access Point.
   c. Client.

12. Each system controller shall be capable of managing and operating at least 750 networked devices (wired or wireless).
   a. Multiple System Controllers may be networked together via LAN connection to scale the system up to 20,000 networked devices.

13. System controller shall support BACnet/IP and BACnet MS/TP protocols to directly interface with BMS and HVAC equipment without the need for additional protocol translation gateways.
   a. BACnet MS/TP shall support 9600 to 115200 baud rate.
   b. System controller shall be BACnet Testing Laboratory (BTL listed) using Device Profile BACnet Building Controller (B-BC) with outlined enhanced features.

14. System controller shall contain a “FIPS 140-2 Level 1 Inside” cryptographic module.

15. System controller shall be available within a NEMA 1 enclosure with Class 1 and Class 2 separation.
   a. Enclosure shall support power input power of 120V ac to 277V ac, or optional 347V ac.

2.06 WIRED NETWORKED DEVICES

A. Wired Networked Occupancy and Photosensors:

1. Occupancy sensors shall sense the presence of human activity within the desired space and fully control the on/off function of the lights.

2. Sensors shall utilize passive infrared (PIR) technology, which detects occupant motion, to initially turn lights on from an off state, thus preventing false on conditions. Ultrasonic or Microwave based sensing technologies shall not be accepted.

3. For applications where a second method of sensing is necessary to adequately detect maintained occupancy (such as in rooms with obstructions), a sensor with an additional “dual” technology shall be used.

4. Dual technology sensors shall have one of its two technologies not require motion to detect occupancy. Acceptable dual technology
includes PIR/Microphonics (also known as Passive Dual Technology or PDT) which both looks for occupant motion and listens for sounds indicating occupants. Sensors where both technologies detect motion (PIR/Ultrasonic) shall not be acceptable.

5. All sensing technologies shall be acoustically passive, meaning they do not transmit sounds waves of any frequency (for example in the Ultrasonic range), as these technologies have the potential for interference with other electronic devices within the space (such as electronic white board readers). Acceptable detection technologies include Passive Infrared (PIR), and/or Microphonics technology. Ultrasonic or Microwave based sensing technologies shall not be accepted.

6. System shall have ceiling, fixture, recessed and corner mounted sensors available, with multiple lens options available customized for specific applications.

7. Communication and low voltage power shall be delivered to each device via standard low voltage network cabling with RJ-45 connectors.

8. All sensors shall have the ability to detect when it is not receiving valid communication and blink its LED in a pattern to visually indicate a potential wiring issue.

9. Sensor programming parameter shall be available and configurable remotely from the software and locally via the device pushbutton.

10. Ceiling mount occupancy sensors shall be available with zero or one integrated dry contact switching relays, capable of switching 1 amp at 24V ac/dc (resistive only).

11. Sensors shall be available with one or two occupancy “poles”, each of which provides a programmable time delay.

12. Sensors shall have optional features for photosensor/daylight override, automatic dimming control, and low temperature/high humidity operation.

13. Photosensor shall provide for an ON/OFF setpoint, and a dead band to prevent the artificial light from cycling. Delay shall be incorporated into the photocell to prevent rapid response to passing clouds.

14. Photosensor and dimming sensor’s setpoint and dead band shall be automatically calibrated through the sensor’s microprocessor by initiating an “Automatic Setpoint Programming” procedure. Minimum and maximum dim settings as well as set-point may be manually entered.

15. Dead band setting shall be verified and modified by the sensor automatically every time the lights cycle to accommodate physical changes in the space (i.e., furniture layouts, lamp depreciation, or lamp outages).

16. A dual zone option shall be available for ON/OFF Photocell, Automatic Dimming Control Photocell, or Combination units. The secondary
daylight zone shall be capable of being controlled as an “offset” from the primary zone.

B. Wired Networked Power Packs and Secondary Packs:

1. Power packs shall incorporate one optional Class 1 relay, optional 0V to 10V dc dimming output, and contribute low voltage Class 2 power to the rest of the system.
2. Power packs shall accept 120V ac or 277V ac (or optionally 347V ac) and carry a plenum rating.
3. Secondary packs shall incorporate the relay and 0V to 10V dc or line voltage dimming output, but shall not be required to contribute system power.
4. Power supplies shall provide system power only, but are not required to switch line voltage circuit.
5. Auxiliary relay packs shall switch low voltage circuits only, capable of switching 1 amp at 40V ac/dc (resistive only).
6. Communication shall be delivered to each device via standard low voltage network cabling with RJ-45 connectors. Secondary packs shall receive low voltage power via standard low voltage network cable.
7. Power pack programming parameters shall be available and configurable remotely from the software and locally via the device push-button.
8. Power pack shall securely mount through a threaded 1/2-inch chase nipple or be capable of being secured within a luminaire ballast/driver channel. Plastic clips into junction box shall not be accepted. All Class 1 wiring shall pass through chase nipple into adjacent junction box without any exposure of wire leads. Note: UL Listing under Energy Management or Industrial Control Equipment automatically meets this requirement, whereas Appliance Control Listing does not meet this safety requirement.
9. When required by local code, power pack must install inside standard electrical enclosure and provide UL recognized support to junction box. All Class 1 wiring is to pass through chase nipple into adjacent junction box without any exposure of wire leads.
10. Power/secondary packs shall be available with the following options:
   a. Power pack capable of full 16-amp switching of all normal power lighting load types, with optional 0V to 10V dimming output capable of up to 100 mA of sink current.
   b. Secondary pack with UL 924 listing for switching of full 16-amp emergency power circuits, with optional 0V to 10V dimming output capable of up to 100 mA of sink current.
   c. Power and secondary packs capable of full 20-amp switching of general purpose receptacle (plug-load) control.
d. Secondary pack capable of full 16-amp switching of all normal power lighting load types.

e. Secondary pack capable of 5-amp switching and dimming 120V ac incandescent lighting loads or 120/277V ac line voltage dimmable fluorescent ballasts (two-wire and three-wire versions).

f. Secondary pack capable of 5-amp switching and dimming of 120/277V ac magnetic low voltage transformers.

g. Secondary pack capable of 4-amp switching and dimming of 120V ac electronic low voltage transformers.

h. Secondary pack capable of louver/damper motor control for skylights.

i. Secondary pack capable of providing a pulse on/pulse off signal for purposes of controlling shade systems via relay inputs.

j. Secondary Pack capable of switching 1 amp at 40V ac/dc (resistive only) with the intent to provide relay signal to auxiliary system (e.g. BMS).

k. Power Supply capable of providing auxiliary bus power (no switched or dimmed load).

C. Wired Networked Relay and Dimming Panel:

1. Relay and dimming panel shall be available with 4, 8, 12, 16, 24, 32, 40, or 48 individual relays per panel, with an equal number of individual 0V to 10V dimming outputs.

2. Optional Field Configurable Relays (FCR) used shall have the following required properties:
   a. Configurable in the field to operate with single-, double-, or triple-pole relay groupings.
   b. Configurable in the field to operate with normally closed or normally open behavior.
   c. Provides visual status of current state and manual override control of each relay.
   d. Listed for the following minimum ratings:
      1) 40A at 120V ac to 480V ac Ballast.
      2) 16A at 120V ac to 277V ac Electronic.
      3) 20A at 120V ac to 277V ac Tungsten.
      4) 20A at 48V dc Resistive.
      5) 2 hp at 120V ac.
      6) 3 hp at 240V ac to 277V ac.
      7) 65kA SCCR at 480V ac.

3. 0 to 10 dimming outputs shall support a minimum of 100 mA sink current per output.

4. Relay and dimming outputs shall be individually programmable to support all standard sequence of operations as defined in this specification.
5. Panel shall be UL 924 listed for control of emergency lighting circuits.
6. Panel shall power itself from an integrated 120V ac to 277V ac or optional 347V ac supply.
7. Panel shall provide a configurable low-voltage sensor input with the following properties:
   a. Configurable to support any of the following input types:
      1) Indoor Photocell.
      2) Outdoor Photocell.
      3) Occupancy Sensor.
      4) Contact Closure.
   b. Low voltage sensor input shall provide plus 24V dc power for the sensor so that additional auxiliary power supplies are not required.
   c. Sensor input supports all standard sequence of operations as defined in this specification.
8. Panel shall provide a contact closure input for each group of eight relays that acts as a panel override to activate the normally configured state of all relays (i.e., normally open or normally closed) in the panel. This input is intended to provide an interface to alarm systems, fire panels, or BMS system to override the panel.
9. Panel shall supply current limited low voltage power to other networked devices connected via low voltage network cable.
10. Panel shall be available with NEMA 1 rated enclosure with the following mounting and cover options:
   a. Surface-mounted for all panel sizes.
   b. Flush-mounted for up to 16 relay panel sizes.
   c. Screw-fastened for up to 16 relay panel sizes.
   d. Hinged cover with keyed lock for all panel sizes.
11. Surface-mounted screw cover options for 8 and 16 relay panel sizes shall be plenum rated.
12. Panel shall be rated from 0-50C for 8 and 16 enclosure sizes, and 0-45C for 32 and 48 enclosure sizes.

D. Wired Networked Communication Bridge:
   1. Device shall surface mount to a standard 4-inch by 4-inch square junction box.
   2. Device shall have 8 RJ-45 ports for connection to lighting control zones (up to 128 devices per port), additional network bridges, and System Controller.
   3. Device shall be capable of aggregating communication from multiple lighting control zones for purposes of minimizing backbone wiring requirements back to system controller.
   4. Device shall be powered with Class 2 low voltage supplied locally via a directly wired power supply, or powered via low voltage network connections from powered lighting control devices (e.g. power packs).
5. Wired Bridge shall be capable of redistributing power from its local supply and connected lighting control zones with excess power to lighting control zones with insufficient local power. This architecture also enables loss of power to a particular area to be less impactful on network lighting control system.

**PART 3 EXECUTION**

3.01 INSTALLATION REQUIREMENTS

A. Installation Procedures and Verification:

1. The successful bidder shall review all required installation and pre-startup procedures with the manufacturer’s representative through pre-construction meetings.
2. The successful bidder shall install and connect the networked lighting control system components according to the manufacturer’s installation instructions, wiring diagrams, the project submittals and plans specifications.
3. The successful bidder shall be responsible for testing of all low voltage network cable included in the bid. Bidder is responsible for verification of the following minimum parameters:
   a. Wire Map (continuity, pin termination, shorts and open connections, etc.).
   b. Length.
   c. Insertion Loss.

B. Coordination with Owner’s IT Network Infrastructure:

1. The successful bidder is required to coordinate with the Owner’s representative to secure all required network connections to the Owner’s IT network infrastructure.
   a. The bidder shall provide to the Owner’s representative all network infrastructure requirements of the networked lighting control system.
   b. The bidder shall provide to the manufacturer’s representative all necessary contacts pertaining to the Owner’s IT infrastructure, to ensure that the system is properly connected and started up.

C. Documentation and Deliverables:

1. The installing Contractor shall be responsible for documenting installed location of all networked devices, including networked luminaires. This includes responsibility to provide as-built plan drawing showing device address barcodes corresponding to locations of installed equipment.
2. The installing Contractor is also responsible for the following additional documentation to the manufacturer’s representative if visualization / graphical floorplan software is provided as part of bid package:
   a. As-Built floor plan drawings showing device address locations required above. All documentation shall remain legible when reproducing/scanning drawing files for electronic submission.
   b. As-Built electrical lighting drawings (reflected ceiling plan) in PDF and CAD format. Architectural floor plans shall be based on as-built conditions.
      1) CAD files shall have layers already turned on/off as desired to be shown in the graphical floorplan background images. The following CAD elements are recommended to be hidden to produce an ideal background graphical image:
         a) Titleblock.
         b) Text- Inclusive of room names and numbers, fixture tags and Drawing notes.
         c) Fixture wiring and homeruns.
         d) Control devices.
         e) Hatching or poché of light fixtures or architectural elements.
      2) CAD files shall be of AutoCAD 2013 or earlier. Revit file overall floor plan views shall be exported to AutoCAD 2013.

3.02 SYSTEM STARTUP

A. Upon completion of installation by the installer, including completion of all required verification and documentation required by the manufacturer, the system shall be started up and programmed.

1. For CAT5 wired devices, low voltage network cable testing shall be performed prior to system startup.

B. System start-up and programming shall include:

1. Verifying operational communication to all system devices.
2. Programming the network devices into functional control zones to meet the required sequence of operation.
3. Programming and verifying all sequence of operations.

C. Initial start-up and programming is to occur on-site.
3.03 PROJECT TURNOVER

A. System Documentation:
   1. Submit software database file with desired device labels and notes completed. Changes to this file will not be made by the factory.
   2. Installing Contractor to grant access to the Owner for the programming database, if requested.

B. Owner Training: Provisions for onsite training for Owner and designated attendees to be included in submittal package.

SECTION 26 14 13
LOW-VOLTAGE SWITCHBOARDS

PART 1  GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. National Electrical Manufacturers Association (NEMA):
   a. PB 2, Deadfront Distribution Switchboards.
   b. 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).

3. UL:
   b. 891, Standard for Safety for Switchboards.
   c. 1561, Standard for Safety for Dry-Type General Purpose and Power Transformers.

1.02 SUBMITTALS

A. Action Submittals:

1. Descriptive product information.
2. Itemized Bill of Material.
3. Dimensional drawings.
4. Operational description.
5. One-line, three-line, and control schematic drawings.
6. Connection and interconnection drawings.
10. Incoming line section equipment data.
11. Conduit entrance locations.
12. Anchoring instructions and details.
13. Seismic anchorage and bracing drawings and cut sheets, as required by Section 26 05 02, Basic Electrical Requirements.
B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 26 05 02, Basic Electrical Requirements.
2. Manufacturer’s installation instructions.
4. Component and attachment testing seismic certificate of compliance.
5. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.
6. Manufacturer’s Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers’ Field Services.

1.03 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

1. Provide the Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, material and equipment shall be labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ in order to provide a basis for approval under NEC.
2. Materials and equipment manufactured within scope of standards published by UL shall conform to those standards and shall have an applied NRTL Listing or Labeling mark.

1.04 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage and deliver prior to 90 percent Project completion the following spare parts:

1. Fuses: One complete set of spare fuses of each current rating, both power and control.
2. Lights: One complete set of spare indicating lights.
3. Paint: One pint, to match enclosure exterior finish in color and quality.
4. Indicating Lamp Pullers: Two each.
5. Indicating Lamp Resistors and Sockets: Two each.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. General Electric.
3. Siemens.
4. Square D.

2.02 GENERAL REQUIREMENTS

A. Equipment suitable for 480Y/277 or 208Y/120-volt, three-phase, four-wire solidly grounded-wye electrical system (as indicated on Drawings) having the available short-circuit current as shown on Drawings.

B. Comply with NEMA PB 2 and UL 891.

C. Switchboard and its major components to be manufactured and assembled by single manufacturer in order to achieve standardization for appearance, operation and maintenance, spare parts replacement, and manufacturer’s services.

D. Lifting lugs on equipment and devices weighing over 100 pounds.

E. Operating Conditions:
   1. Ambient Temperature: Maximum 40 degrees C.
   2. Equipment shall be fully rated without derating for the above operating conditions.

2.03 STATIONARY STRUCTURE

A. Type: NEMA PB 2 construction, dead front, completely metal enclosed, self-supporting, front access only.

B. Sections bolted together to form one rigid assembly capable of being moved into position and bolted directly to floor without use of floor sills.

2.04 ENCLOSURE

A. Equipment Finish: Baked enamel applied over rust-inhibiting phosphated base coating.

   1. Color:
      a. Exterior: ANSI No. 61, Sky Blue Grey finish as approved by Engineer.
      c. Unpainted Parts: Plated for corrosion resistance.
B. Indoor Enclosure: NEMA 250, Type I Gasketed or Type 12:
   1. Rear, full-height, bolt-on panels for each enclosure section.
   3. Front Access:
      a. Service line and load terminations, internal devices, device and
         bolted bus connections, and protective device removal,         
         serviceable from front only.
      b. Sections aligned across back to permit placement flush against
         wall.
      c. Working Space: As required by NFPA 70.
   4. Transition sections as required or shown.
   5. Side and Top Covers: Removable, captive, screw-on plates with formed
      edges on each side.
   6. Front Cover: Hinged door with formed edges.

2.05 BUSWORK

A. Material: Phase noninsulated, tin-plated copper throughout entire length of
   sufficient cross section to limit temperature rise at rated current to
   55 degrees C.

B. Bus Arrangement: A-B-C, left-to-right, top-to-bottom, and front-to-rear, as
   viewed from front.

C. Brace for short-circuit currents as indicated on Drawings.

D. Main Horizontal Bus: Nontapered, continuous current rating as indicated on
   Drawings.

E. Neutral Bus: Continuous current rating to be 50 percent of main horizontal
   bus rating.

F. Ground Bus:
   1. Copper.
   2. Rating: 300 amperes.
   3. Bolted to each vertical section.

G. Extend each bus entire length of switchboard.
2.06 PROTECTIVE DEVICES

A. Molded-Case Circuit Breakers:
   1. Main and Branch Feeder Protective Devices: Individually mounted, suitable for use with 75 degree C wire at full 75 degree C ampacity when mounted in switchboard.
   3. Breakers 225-Ampere Frame and Above: Continuously adjustable magnetic pickups five to ten times trip rating.
   5. Interrupting Rating: As shown on Drawings.
   6. Mechanical interlock to prevent opening compartment door while breaker is in closed position.

B. Ground Fault Protection:
   1. Ground sensor encircling phase conductors and neutral conductor, where used.
   2. Solid-state sensing relay and monitor/test panel.
   3. Zero sequence current detection, adjustable over range shown.
   4. Monitor panel with fault detection indicating light, test, and reset buttons.
   5. Control Power Source: Suitable to operate circuit protective device when connected to faulted phase conductor.

C. Arc Flash Reduction Maintenance System:
   1. Trip units for circuit breakers 600-amp frame or greater shall be equipped with an arc flash reduction maintenance system.
   2. System to allow operator to enable a maintenance mode, implementing a preset accelerated instantaneous override trip to reduce arc flash energy.
   3. An LED lamp and indicator flag on the trip unit shall indicate when the trip unit is in maintenance mode.

D. Breaker Accessories:
   1. Arc Flash Reduction Maintenance System (ARMS), indicating light and flag.
   2. Portable breaker lifter.

2.07 SOLID-STATE TRIP UNIT

A. Flux-shift trip and current sensors.
B. Protective Programmers:

2. No external relays or accessories.
3. Printed circuit cards with gold-plated contacts.
4. Programmable Controls:
   a. Fixed-point, with repetitive accuracy and precise unit settings.
   b. Trip adjustments made by nonremovable, discrete step switching.
5. Field-Installable Rating Plugs:
   a. Long-time pickup LED indicator and test receptacle.
   b. Matching load and cable requirements.
   c. Interlocked with tripping mechanism.
   d. Breaker to remain trip-free with plug removed.
   e. Keyed rating plugs to prevent incorrect application.
7. Selective Coordination Time/Current Curve Shaping Adjustable Functions:
   a. Current setting.
   b. Long-time pickup.
   c. Long-time delay.
   d. Instantaneous pickup with short-time.
   e. Short-time pickup.
   f. Short-time delay for with I2T function, and IN-OUT switch.
   g. Ground fault pickup.
   h. Ground fault delay with I2T function.
   i. High instantaneous pickup with short-time delay.
   j. Fixed, instantaneous pickup.
8. Fault Trip Indicators: Mechanical push-to-reset type for overload and short-circuit overload plus ground fault trip.
9. Rejection Pins: For each programmer frame size.

C. Phase Current Sensors:

1. Multi-ratio type.
2. Fixed, mounted on breaker frame.
4. One toroidal type for each phase.
5. Wired to shorting terminal blocks.

D. Ground Fault Sensor:

1. Neutral bar single-ratio CT mounted in cable compartment.
3. Shorting bar.
2.08 CONTROL WIRING

A. Control, Instrumentation, and Power/Current Circuits: NFPA 70, Type SIS, single-conductor, Class B, stranded copper, rated 600 volts.

B. Transducer Output/Analog Circuits: Shielded cable rated 600 volts, 90 degrees C minimum.

C. Conductor Lugs: Preinsulated, self-locking, spade-type, with reinforced sleeves.

D. Identification: Individually, with permanent wire markers at each end.

E. Enclose in top and vertical steel wiring troughs, and front-to-rear in nonmetallic wiring troughs.

F. Splices: Not permitted in switchboard wiring.

2.09 TERMINAL BLOCKS

A. Enclosed in steel wiring troughs.

B. Rated 600 volts, 30 amperes minimum, one-piece barrier type with strap screws.

C. Shorting type for current transformer leads.

D. Provide terminal blocks for:
   1. Conductors connecting to circuits external to switchboard.
   2. Internal circuits crossing shipping splits.
   3. Equipment parts requiring replacement and maintenance.

E. Spare Terminals: Not less than 20 percent.

F. Group terminal blocks for external circuit wiring leads.

G. Maintain 6-inch minimum space between columns of terminal blocks.

H. Identification: Permanent, for each terminal and columns of terminal blocks.

I. Manufacturer and Product: General Electric; Type EB-5.

2.10 POWER METER

A. As specified in Section 26 09 13, Power Measurement and Control.
2.11 KEY INTERLOCK
A. Mechanical lock cylinder within as shown on Drawings.
B. Keys to be captive when breakers are closed.

2.12 SURGE PROTECTIVE DEVICES
A. As indicated on Drawings.
B. Provide factory mounted within motor control center utilizing NRTL-recognized mounting device.
C. SPD shall be as manufactured by Surge Suppression, Inc. (SSI). No exceptions or substitutions.

2.13 IDENTIFICATION
A. Nameplates:
   1. Master:
      a. Deep-etched aluminum, with manufacturer’s name and model number.
      b. Riveted to main vertical section.
   2. Circuit Breaker Cubicle and Door-Mounted Device:
      a. Engraved, phenolic.
      b. Color: White, engraved to a black core.
      c. Characters: Block-type, 1/4-inch high.
      d. Size: Manufacturer’s standard.
      e. Inscription: As shown on one-line diagram.
      g. Attachment Screws: Stainless steel panhead.

B. Section Identification:
   1. Stamped metallic, riveted to each vertical section.
   2. Serial number, bus rating, and section reference number.
   3. Size: Manufacturer’s standard.

C. Cubicle Labels:
   1. Nonmetallic, applied inside each cubicle compartment.
   2. Device serial number, rating, and description.

D. Metering Instruments: Meter type identified on meter face below pointer or dial.
E. Control Switches: Deep etched, aluminum escutcheon plate.

F. Relays and Devices:
   1. Stamped metallic, riveted to instrument case.
   2. Manufacturer’s name, model number, relay type, and rating data.

G. Switchboard Sign:
   1. Two signs each on front of switchboard.
   2. Engraved, phenolic.
   3. Size: Manufacturer’s standard.
   5. Characters: Gothic-type, 1 inch high.
   6. Inscription: DANGER/HIGH VOLTAGE/KEEP OUT.
   7. Attachment: Four rivets each sign.

2.14 FACTORY TESTING

A. Performance tests in accordance with UL 891 and production tests in accordance with NEMA PB-2.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer’s instructions and recommendations.

B. Secure to mounting pads with anchor bolts of sufficient size and number adequate for specified seismic conditions.

C. Install plumb and in longitudinal alignment with pad or wall.

D. Coordinate terminal connections with installation of secondary feeders.

3.02 MANUFACTURER’S SERVICES

A. Furnish manufacturer’s representative in accordance with Section 01 43 33, Manufacturers’ Field Services, for the following services at Site, for minimum person-days listed below, travel time excluded:

   1. 1 person-day for installation assistance, final adjustment, and initial energization of equipment.
   2. 1 person-day for functional and performance testing.
   3. 1 person-day for adjustment of relay settings.
B. Furnish startup services and training of Owner’s personnel at such times as requested by Owner.
SECTION 26 20 00
LOW-VOLTAGE AC INDUCTION MOTORS

PART 1 GENERAL

1.01 RELATED SECTIONS

A. This Section applies only when referenced by a motor-driven equipment specification. Application, horsepower, enclosure type, mounting, shaft type, synchronous speed, and deviations from this Section will be listed in the specific motor-driven equipment specification, and on the accompanying motor data sheet. Where such deviations occur, they shall take precedence over this Section.

1.02 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Bearing Manufacturers Association (ABMA):
   a. 9, Load Ratings and Fatigue Life for Ball Bearings.
   b. 11, Load Ratings and Fatigue Life for Roller Bearings.

2. Institute of Electrical and Electronics Engineers, Inc. (IEEE):
   a. 112, Standard Test Procedure for Polyphase Induction Motors and Generators.
   b. 620, Guide for the Presentation of Thermal Limit Curves for Squirrel Cage Induction Machines.
   c. 841, Standard for Petroleum and Chemical Industry—Premium Efficiency Severe Duty Totally Enclosed Fan-Cooled (TEFC) Squirrel Cage Induction Motors—Up to and Including 370 kW (500 hp).

3. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
   b. C50.41, Polyphase Induction Motors for Power Generating Stations.
   c. MG 1, Motors and Generators.

5. UL:
   b. 674, Standard for Safety for Electric Motors and Generators for Use in Division 1 Hazardous (Classified) Locations.
   c. 2111, Standard for Safety for Overheating Protection for Motors.
1.03 DEFINITIONS

A. Inverter Duty Motor: Motor meeting applicable requirements of NEMA MG 1, Section IV, Parts 30 and 31.

B. Motor Nameplate Horsepower: That rating after any derating required to allow for extra heating caused by the harmonic content in the voltage applied to the motor by its controller.

C. ODP: Open drip-proof enclosure.

D. TEFC: Totally enclosed, fan-cooled enclosure.

E. TENV: Totally enclosed, nonventilated enclosure.

F. WPI: Open weather protected enclosure, Type I.

G. EXP: Explosion Proof for Classified Areas.

1.04 SUBMITTALS

A. Action Submittals:
   1. Descriptive information.
   2. Nameplate data in accordance with NEMA MG 1.
   3. Additional Rating Information:
      a. Service factor.
      b. Locked rotor current.
      c. No load current.
      d. Safe stall time for motors 200 hp and larger.
      e. Adjustable frequency drive motor load classification (for example, variable torque) and minimum allowable motor speed for that load classification.
      f. Guaranteed minimum full load efficiency and power factor.
   4. Enclosure type and mounting (such as, horizontal, vertical).
   5. Dimensions and total weight.
   6. Conduit box dimensions and usable volume as defined in NEMA MG 1 and NFPA 70.
   7. Bearing type.
   8. Bearing lubrication.
   10. Space heater voltage and watts.
   11. Description, ratings, and wiring diagram of motor thermal protection.
   12. Motor sound power level in accordance with NEMA MG 1.
   13. Maximum brake horsepower required by the equipment driven by the motor.
14. Description and rating of submersible motor moisture sensing system.
15. Anchorage and bracing data sheets and Drawings as required by Section 26 05 02, Basic Electrical Requirements.

B. Informational Submittals:

1. Anchorage and bracing calculations as required by Section 26 05 02, Basic Electrical Requirements.
2. Factory test reports, certified.
3. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection, Observation, and Testing.
4. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.

PART 2  PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. General Electric.
2. Baldor.
4. TECO-Westinghouse Motor Co.
5. Toshiba International Corp., Industrial Division.

2.02 GENERAL

A. For multiple units of the same type of equipment, furnish identical motors and accessories of a single manufacturer.

B. In order to obtain single source responsibility, use a single supplier to provide drive motor, its driven equipment, and specified motor accessories.

C. Meet requirements of NEMA MG 1 for premium efficiency, constant speed, and across-the-line start motors. Inclusive of Section IV, Parts 31 and 32, for premium efficiency, variable speed motors.

D. Motors shall be specifically designed for the use and conditions intended, with a NEMA design letter classification to fit the application.

E. Lifting lugs on motors weighing 100 pounds or more.
F. Operating Conditions:
   1. Maximum ambient temperature not greater than 40 degrees C.
   2. Motors shall be suitable for operating conditions without reduction being required in nameplate rated horsepower or exceeding rated temperature rise.
   3. Overspeed in either direction in accordance with NEMA MG 1.

2.03 HORSEPOWER RATING

A. As designated in motor-driven equipment specification, and as shown on Drawings.

B. Constant Speed Applications: Brake horsepower of driven equipment at any operating condition not to exceed motor nameplate horsepower rating, excluding service factor.

C. Adjustable Frequency and Adjustable Speed Applications (Inverter Duty Motor):
   1. Driven equipment brake horsepower at any operating condition not to exceed motor nameplate horsepower rating, excluding service factor.
   2. Full speed range inverter duty, variable torque application.

2.04 SERVICE FACTOR

A. Inverter-Duty Motors: Dual rated 1.15 for constant speed operation, and 1.0 for variable speed operation, at rated ambient temperature.

B. Other Motors: 1.15 at rated ambient temperature.

2.05 VOLTAGE AND FREQUENCY RATING

A. System Frequency: 60-Hz.

B. Voltage Rating: Unless otherwise indicated in motor-driven equipment specification:

<table>
<thead>
<tr>
<th>Size</th>
<th>Voltage</th>
<th>Phase</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2 hp and smaller</td>
<td>115</td>
<td>1</td>
</tr>
<tr>
<td>3/4 hp through 400 hp</td>
<td>460</td>
<td>3</td>
</tr>
</tbody>
</table>

C. Suitable for full voltage starting.
D. 40 hp and larger suitable for reduced voltage starting with 65 percent or 80 percent voltage tap settings on reduced inrush motor starters.

E. 40 hp and larger suitable for adjustable speed, 0-Hz to 60-Hz, with 6-, 12- and 18-pulse inverter drive, variable torque application.

F. Suitable for accelerating the connected load with supply voltage at motor starter supply terminals dipping to 90 percent of motor rated voltage.

2.06 EFFICIENCY AND POWER FACTOR

A. For all motors except single-phase, under 1 hp, multispeed, short-time rated and submersible motors, or motors driving gates, valves, elevators, cranes, trolleys, and hoists:

1. Efficiency:
   a. Tested in accordance with NEMA MG 1, Paragraph 12.59.
   b. Guaranteed minimum at full load in accordance with NEMA MG 1 Table 12-12, Full-load Efficiencies for NEMA Premium Efficiency Electric Motors Rated 600 Volts or Less (Random Wound), or as indicated in motor-driven equipment specification.

2. Power Factor: Guaranteed minimum at full load shall be manufacturer’s standard or as indicated in motor-driven equipment specification.

2.07 LOCKED ROTOR RATINGS

A. Locked rotor kVA Code F or lower, if motor horsepower not covered by NEMA MG 1 tables.

B. Safe Stall Time: 12 seconds or greater.

2.08 INSULATION SYSTEMS

A. Single-Phase, Fractional Horsepower Motors: Manufacturer’s standard winding insulation system.

B. Three-phase and Integral Horsepower Motors: Unless otherwise indicated in motor-driven equipment specification, Class F with Class B rise at nameplate horsepower and designated operating conditions.

2.09 ENCLOSURES

A. Conform to NEMA MG 1.

B. TEFC and TENV: Furnish with drain hole with porous drain/weather plug.
C. Submersible: In accordance with Article Special Motors.

D. Explosion-Proof (EXP):
   1. TEFC listed to meet UL 674 and NFPA 70 requirements for Class I, Division 2, Group D hazardous locations.
   2. Drain holes with drain and breather fittings.
   3. Integral thermostat opening on excessive motor temperature in accordance with UL 2111 and NFPA 70.
   4. Terminate thermostat leads in terminal box separate from main terminal box.

2.10 TERMINAL (CONDUIT) BOXES

A. Oversize main terminal boxes for motors.

   1. 40 hp Motors and Larger: 3-inch conduit opening in the bottom.
   2. Below 40 hp Motors: 1-1/2-inch conduit opening in the bottom.
   3. Fan Motors: Manufacturer’s standard conduit opening.

B. Diagonally split, rotatable to each of four 90-degree positions. Threaded hubs for conduit attachment.

C. Except ODP, furnish gaskets between box halves and between box and motor frame.

D. Minimum usable volume in percentage of that specified in NEMA MG 1, Section 1, Paragraph 4.19 and NFPA 70, Article 430:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Horsepower</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Below 600</td>
<td>15 through 125</td>
<td>500</td>
</tr>
<tr>
<td>Below 600</td>
<td>150 through 300</td>
<td>275</td>
</tr>
</tbody>
</table>

E. Terminal for connection of equipment grounding wire in each terminal box.

F. Coordinate motor terminal box conduit entries versus size and quantity of conduits shown on Drawings.
2.11 BEARINGS AND LUBRICATION

A. Horizontal Motors:
   1. 3/4 hp and Smaller: Permanently lubricated and sealed ball bearings, or regreaseable ball bearings in labyrinth sealed end bells with removable grease relief plugs.
   2. 1 hp through 400 hp: Regreaseable ball bearings in labyrinth sealed end bells with removable grease relief plugs.
   3. For Direct Drive Equipment: Minimum 100,000 hours L-10 bearing life for ball and roller bearings as defined in ABMA 9 and ABMA 11.
   4. For Belt Driven Equipment: Minimum 30,000 hours L-10 bearing life for ball and roller bearings as defined in ABMA 9 and ABMA 11.

B. Vertical Motors:
   1. Thrust Bearings:
      a. Antifriction bearing.
      b. Manufacturer’s standard lubrication 100 hp and smaller.
      c. Oil lubricated 125 hp and larger.
      d. Minimum 50,000 hours L-10 bearing life.
   2. Guide Bearings:
      a. Manufacturer’s standard bearing type.
      b. Manufacturer’s standard lubrication 200 hp and smaller.
      c. Oil lubricated 250 hp and larger.
      d. Minimum 100,000 hours L-10 bearing life.

C. Regreasable Antifriction Bearings:
   1. Readily accessible, grease injection fittings.
   2. Readily accessible, removable grease relief plugs.

D. Oil Lubrication Systems:
   1. Oil reservoirs with sight level gauge.
   2. Oil fill and drain openings with opening plugs.

E. Inverter Duty Rated Motors, Bearing Isolation: Motors larger than 50 hp shall have electrically isolated bearings to prevent stray current damage.

2.12 NOISE

A. Measured in accordance with NEMA MG 1.
B. Motors Controlled by Adjustable Frequency Drive Systems: Shall not exceed 3 dBA higher than NEMA MG 1 across the entire operating range of 0 Hz to 60 Hz.

2.13 BALANCE AND VIBRATION CONTROL
A. In accordance with NEMA MG 1, Part 7.

2.14 EQUIPMENT FINISH
A. Protect Motor for Service Conditions:
   1. ODP Enclosures: Indoor, nonconditioned, ventilated only atmospheres.
   2. Other Enclosures: Outdoor atmospheres, including moisture and direct sunlight exposure.

B. External Finish: Prime and finish coat manufacturer’s standard. Finish color manufacturer’s standard.

C. Internal Finish: Bore and end turns coated with clear polyester or epoxy varnish.

2.15 SPECIAL FEATURES AND ACCESSORIES
A. Screen Over Air Openings: Stainless steel on motors with ODP and WPI enclosures meeting requirements for guarded machine in NEMA MG 1, and attached with stainless steel screws.

B. Winding Thermal Protection:
   1. Thermostats:
      a. Motors for constant speed application 10 hp up to 100 hp.
      b. Motors for adjustable speed application 40 hp up to 100 hp.
      c. Bi-metal disk or rod type thermostats embedded in stator windings.
      d. Automatic reset contacts rated 120V ac, 5 amps minimum, opening on excessive temperature. (Provide manual reset at motor controller.)
   2. Thermistors:
      a. Motors for constant speed application 100 hp and larger.
      b. Motors for adjustable speed application 100 hp and larger.
      c. Thermistor embedded in each stator phase winding before winding dip and bake process.
      d. In intimate contact with winding conductors.
e. Solid-state thermistor control module for mounting in motor controller cabinet located in a remote location. Control module supplied by motor manufacturer.

f. Control module rated for 120V ac power supply.

g. Control module automatically reset contact for external use rated 120V ac, 5 amps minimum, opening on abnormally high winding temperature. Provide manual reset at motor controller. Leads brought to separate motor terminal box.

C. Space Heaters:

1. Provide winding space heaters with leads wired out to same motor terminal box as winding thermal protection.

2. Unless shown otherwise, heater shall be suitable for 120V ac supply, with wattage suitable for motor frame size.

D. Nameplates:

1. Raised or stamped letters on stainless steel or aluminum.

2. Display motor data required by NEMA MG 1, Paragraph 10.39 and Paragraph 10.40 in addition to bearing numbers for both bearings.

3. Premium efficiency motor nameplates to display NEMA nominal efficiency, guaranteed minimum efficiency, full load power factor, and maximum allowable kVAR for power factor correction capacitors.

4. Separate nameplate indicating motor is Inverter Duty Rated.

E. Anchor Bolts: Provide meeting manufacturer’s recommendations and of sufficient size and number for specified seismic condition.

2.16 SPECIAL MOTORS

A. Requirements in this article take precedence over conflicting features specified elsewhere in this section.

B. Inverter Duty Motor:

1. Motor supplied power by adjustable voltage and adjustable frequency drives shall be inverter duty rated in accordance with NEMA MG 1, Parts 30 and 31.

2. Provide winding insulation rated 1,600 peak volts, minimum.

3. Meet or exceed NEMA MG 1 corona inception voltage rating.

4. Suitable for operation over entire speed range indicated.

5. Provide forced ventilation where speed ratio is greater than published range for motor provided.
6. Shaft grounding device, motors larger than 50 hp shall be provided with shaft grounding brush or conductive micro fiber shaft grounding ring solidly bonded to grounded motor frame in accordance with manufacturer’s recommendations.
   a. Manufacturers:
      1) Grounding Brush: Sohre Turbomachinery, Inc.
      2) Grounding Ring: EST-Aegis.

C. Submersible Pump Motor:

1. Manufacturers:
   a. Reliance Electric.
   b. Xylem Flygt Corp.

2. At 100 Percent Load:
   a. Motors with Speeds Less than 1,200 rpm: Manufacturer’s standard.
   b. Motors with Speeds 1,200 rpm and Greater:

<table>
<thead>
<tr>
<th>Horsepower</th>
<th>Guaranteed Minimum Efficiency</th>
<th>Guaranteed Minimum Power Factor</th>

</tbody>
</table>

3. Insulation System: Manufacturer’s standard Class B or Class F.
4. Motor capable of running dry continuously.
5. Enclosure:
   a. Hermetically sealed, watertight, for continuous submergence up to 65-foot depth.
   b. Listed to meet UL 674 and NFPA 70 requirements for Class I, Division 1, Group D hazardous atmosphere.
   c. Seals: Tandem mechanical.
6. Bearing and Lubrication:
   a. Permanently sealed and lubricated, replaceable antifriction guide and thrust bearings.
   b. Minimum 15,000 hours L-10 bearing life.
7. Inrush kVA/horsepower no greater than NEMA MG 1 and NFPA 70, Code F.
8. Winding Thermal Protection:
   a. Thermal sensor and switch assembly, one each phase, embedded in stator windings and wired in series.
   b. Switches normally closed, open upon excessive winding temperature, and automatically reclose when temperature has cooled to safe operating level.
   c. Switch contacts rated at 5 amps, 120V ac.

9. Motor Seal Failure Moisture Detection:
   a. Probes or sensors to detect moisture beyond seals.
   b. Probe or sensor monitoring module for mounting in motor controller, suitable for operation from 120V ac supply.
   c. Monitoring module with control power transformer, probe test switch and test light, and two independent 120V ac contacts, one opening and one closing when flux of moisture is detected.

10. Bearing Overtemperature Protection for Motors Larger than 100 hp:
    a. Sensor on lower bearing housing monitoring bearing temperature.
    b. Any monitoring relay necessary to provide 120V ac contact opening on bearing overtemperature.

11. Winding thermal protection, moisture detection, and bearing overtemperature specified above may be monitored by single device providing two independent 120V ac contacts, one closing and one opening on malfunction.

12. Connecting Cables:
    a. One cable containing power, control, and grounding conductors.
    b. Cable suitable for hard service, submersible duty with watertight seal where cable enters motor.
    c. Length: 30 feet minimum.
    d. UL 83 listed and sized in accordance with NFPA 70.

D. Classified (Hazardous) Location Motors (EXP):

1. See Article Enclosures, for EXP enclosure requirements.
2. In accordance with IEEE 841.
3. TEFC in accordance with NEMA MG 1.
4. Suitable for indoor or outdoor installation in severe-duty applications including high humidity, chemical (corrosive), dirty, or salty atmospheres.
5. Motor Frame, End Shields, Terminal Box, and Fan Cover: Cast iron.
9. Gaskets between terminal box halves and terminal box and motor frame.
10. Extra slinger on rotor shaft to prevent moisture seepage along shaft into motor.
11. Double shielded bearings.
12. 125,000 hours minimum L-10 bearing life for direct-connected loads.
14. Coated rotor and stator air gap surfaces.
15. Insulation System, Windings, and Connections:
   a. Class F insulation, Class B rise or better at 1.0 service factor.
   b. Multiple dips and bakes of nonhygroscopic polyester varnish.
16. Service Factor:
   a. At 40 Degrees C Ambient: 1.15.
   b. At 65 Degrees C Ambient: 1.00.

2.17 FACTORY TESTING

A. Tests:
   1. In accordance with IEEE 112 for polyphase motors.
   2. Routine (production) tests in accordance with NEMA MG 1. Test multispeed motors at all speeds.
   3. For energy efficient motors, test efficiency and power factor at 50 percent, 75 percent, and 100 percent of rated horsepower:
      b. On motors of 100 hp and smaller, furnish certified copy of motor efficiency test report on an identical motor.
   4. Provide certified test reports for all polyphase motors 100 hp and larger.

B. Test Report Forms:
   2. Efficiency and power factor by Test Method B, IEEE 112, Form A-2, and NEMA MG 1, Table 12-12.

PART 3 EXECUTION

3.01 INSTALLATION

A. In accordance with manufacturer’s instructions and recommendations.

B. Align motor carefully and properly with driven equipment.

C. Secure equipment to mounting surface with anchor bolts.
3.02 MANUFACTURER’S SERVICES

A. Furnish manufacturer’s representative at Site in accordance with Section 01 43 33, Manufacturers’ Field Services, for installation assistance, inspection, equipment testing, and startup assistance for motors larger than 100 hp.

B. Manufacturer’s Certificate of Proper Installation.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

2. Institute of Electrical and Electronics Engineers (IEEE): C57.96, Guide for Loading Dry Type Transformers.
3. National Electrical Contractor’s Association (NECA): 409, Recommended Practice for Installing and Maintaining Dry-Type Transformers.
4. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
   b. ST 20, Dry-Type Transformers for General Applications.
6. UL:
   a. 486E, Standard for Equipment Wiring Terminals for use with Aluminum and/or Copper Conductors.
   b. 489, Standard for Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures.
   c. 1561, Standard for Dry-Type, General Purpose, and Power Transformers.

1.02 SUBMITTALS

A. Action Submittals:

1. Descriptive information.
2. Dimensions and weight.
3. Transformer nameplate data, including efficiency.
4. Schematic and connection diagrams.
5. Anchorage and bracing drawings and cut sheets as required by Section 26 05 02, Basic Electrical Requirements.
B. Informational Submittals:

1. Test Report: Sound test certification for dry type power transformers (0 volt to 600 volt, primary).
2. Anchorage and bracing calculations as required by Section 26 05 02, Basic Electrical Requirements.
3. Component and attachment testing seismic certificate of compliance.

**PART 2 PRODUCTS**

**2.01 GENERAL**

A. UL 1561, NEMA ST 20, unless otherwise indicated.

B. Dry-type, self-cooled, two-winding, with copper windings.

C. Units larger than 5 kVA suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.

D. Efficiency: Meet or exceed DOE 2016 efficiency requirements.

E. Maximum Sound Level per NEMA ST 20:

1. 40 decibels for 0 kVA to 9 kVA.
2. 45 decibels for 10 kVA to 50 kVA.
3. 50 decibels for 51 kVA to 150 kVA.
4. 55 decibels for 151 kVA to 300 kVA.
5. 60 decibels for 301 kVA to 500 kVA.

F. Overload Capability: Short-term overload per IEEE C57.96.

G. Wall Bracket: For single-phase units, 15 kVA to 37-1/2 kVA, and for three-phase units, 15 kVA to 30 kVA.

H. Vibration Isolators:

1. Rated for transformer’s weight.
2. Isolation Efficiency: 99 percent, at fundamental frequency of sound emitted by transformer.
3. Less Than 30 kVA: Isolate entire unit from structure with external vibration isolators.
4. 30 kVA and Above: Isolate core and coil assembly from transformer enclosure with integral vibration isolator.
I. Manufacturers:

1. General Electric Co.
2. Square D Co.

2.02 GENERAL PURPOSE TRANSFORMER

A. Insulation Class and Temperature Rise: Manufacturer’s standard.

B. Core and Coil:

1. Fully encapsulated for single-phase units 1/2 kVA to 25 kVA and for three-phase units 3 kVA to 15 kVA.
2. Thermosetting varnish impregnated for single-phase units 37.5 kVA and above, and for three-phase units 30 kVA and above.

C. Enclosure:

1. Single-Phase, 3 kVA to 25 kVA: NEMA 250, Type 3R, nonventilated.
2. Single-Phase, 37-1/2 kVA and Above: NEMA 250, Type 2, ventilated.
3. Three-Phase, 3 kVA to 15 kVA: NEMA 250, Type 3R, nonventilated.
4. Three-Phase, 30 kVA and Above: NEMA 250, Type 2, ventilated.
5. Outdoor Locations: NEMA 250, Type 3R.

D. Voltage Taps:

1. Single-Phase, 3 kVA to 10 kVA: Four 2-1/2 percent, full capacity; two above and two below normal voltage rating.
2. Single-Phase, 15 kVA and Above: Four 2-1/2 percent, full capacity; two above and two below normal voltage rating.
3. Three-Phase, 3 kVA to 15 kVA: Four 2-1/2 percent, full capacity; two above and two below normal voltage rating.
4. Three-Phase, 30 kVA and Above: Four 2-1/2 percent, full capacity; two above and two below normal voltage rating.

E. Impedance: 3 percent minimum on units 75 kVA and larger.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with NECA and manufacturer’s instructions.

B. Load external vibration isolator such that no direct transformer unit metal is in direct contact with mounting surface.
ZINK DAM IMPROVEMENTS

C. Provide moisture-proof, flexible conduit for electrical connections.

D. Connect voltage taps to achieve (approximately) rated output voltage under normal plant load conditions.

E. Provide wall brackets for single-phase units, 15 kVA to 167-1/2 kVA, and three-phase units, 15 kVA to 30 kVA.

   g. 943, Ground-Fault Circuit-Interrupters.
   h. 1699, Standard for Arc-Fault Circuit-Interrupters.

1.02  SUBMITTALS

A. Action Submittals:

1. Manufacturer’s data sheets for each type of panelboard, protective device, accessory item, and component.
2. Manufacturer’s shop drawings including dimensioned plan, section, and elevation for each panelboard type, enclosure, and general arrangement.
3. Tabulation of features for each panelboard to include the following:
   a. Protective devices with factory settings.
   c. Space for future protective devices.
   d. Voltage, frequency, and phase ratings.
e. Enclosure type.
f. Bus and terminal bar configurations and current ratings.
g. Provisions for circuit terminations with wire range.
h. Short circuit current rating of assembled panelboard at system voltage.
i. Features, characteristics, ratings, and factory settings of auxiliary components.
j. Anchorage and bracing drawings and cut sheets, as required by Section 26 05 02, Basic Electrical Requirements.

B. Informational Submittals:

1. Anchorage and bracing calculations as required by Section 26 05 02, Basic Electrical Requirements.
2. Manufacturer’s recommended installation instructions.
3. Component and attachment testing seismic certificate of compliance.

1.03 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

1. Provide the Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, material and equipment shall be labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ in order to provide a basis for approval under NEC.
2. Materials and equipment manufactured within scope of standards published by UL shall conform to those standards and shall have an applied NRTL Listing or Labeling mark.

1.04 EXTRA MATERIALS

A. Extra Materials: Furnish, tag, and box for shipment and storage the following special tools and material:

<table>
<thead>
<tr>
<th>Item</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Touch-up paint for panelboards</td>
<td>One half-pint container</td>
</tr>
<tr>
<td>Special tools required to maintain or dismantle</td>
<td>One complete set</td>
</tr>
</tbody>
</table>
PART 2  PRODUCTS

2.01  MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:
   2. General Electric Co.
   3. Square D Co.
   4. Siemens.

B. Panelboards shall be of the same manufacturer as equipment furnished under Section 26 14 13, Low-Voltage Switchboards.

2.02  GENERAL

A. Provide low-voltage panelboards for application at 600V or less in accordance with this section.

B. Provide equipment in accordance with NEMA PB 1, NFPA 70, and UL 67.

C. Wire Terminations:
   1. Provide panelboard assemblies, including protective devices, suitable for use with 75 degrees C or greater wire insulation systems at NFPA 70, 75 degrees C conductor ampacity, and in accordance with UL 486E.
   2. Lugs for termination of copper feeder phase and neutral conductors shall be replaceable, bolted mechanical or crimp compression type.

D. Load Current Ratings:
   1. Unless otherwise indicated, load current ratings for panelboard assemblies, including bus and circuit breakers, are noncontinuous as defined by NEC. Continuous ratings shall be 80 percent of noncontinuous rating.
   2. Where indicated “continuous” or “100 percent”, selected components and protective devices shall be rated for continuous load current at value shown.

E. Short Circuit Current Rating (SCCR): Fully rated short circuit rating for each panelboard assembly shall be no less than the following:
   1. Minimum SCCR at 208Y/120 or 120/240 volts shall be 10,000 amperes rms symmetrical.
2. Minimum SCCR at 480Y/277 volts shall be 14,000 amperes rms symmetrical.
3. As indicated on Drawings and in the Panelboard Schedules.

F. Series-Connected Short Circuit Current Ratings: Panelboards shall be fully rated; application of series-connected device ratings is unacceptable.

2.03 OVERCURRENT PROTECTIVE DEVICES

A. Overcurrent Device Mounting and Arrangement: Design panelboards to accommodate device installation and replacement without disturbing adjacent devices and without removing main bus.

B. Overcurrent Protective Devices: In accordance with NEMA KS 1, UL 98, and UL 489. Protective devices shall be adapted to panelboard installation.

C. Provisions for Future Overcurrent Device:
   1. Provide space, mountings and bus connections such that like device may be installed without additional hardware.
   2. Panel openings shall be closed with individual removable cover for each provision for future device.
   3. Unless otherwise indicated, “spaces” in panelboards shall be fully equipped provision for future like devices.
   4. Provisions for future devices shall be suitable devices rated no less than 60 amperes.

D. Protective Device Locking: Furnish provisions for handle padlocking for main, subfeed, and branch devices in all cases.

E. Branch Protective Devices:
   1. Provide Wire Lug Load Connections: Mechanical or crimp compression type, removable/replaceable, and suitable for 75 degrees C rated conductors without derating switch nor conductor ampacity.
   2. Provide a nameplate for each circuit, blanks for spares.

2.04 CIRCUIT BREAKERS

A. General: Thermal-magnetic unless otherwise indicated, quick-make, quick-break, molded case, of indicating type showing ON/OFF and TRIPPED positions of operating handle. Circuit breakers shall comply with Section 26 05 04, Basic Electrical Materials and Methods.

B. Bus Connection: Bolt-on circuit breakers in all panelboards.
C. Trip Mechanism:
   1. Individual permanent thermal and magnetic trip elements in each pole.
   2. Variable magnetic trip elements with a single continuous adjustment 3X to 10X for frames greater than 100 amps.
   3. Two and three pole, common trip.
   4. Automatically opens all poles when overcurrent occurs on one pole.
   5. Test button on cover.
   6. Calibrated for 40 degrees C ambient, unless shown otherwise.

D. Unacceptable Substitution:
   1. Do not substitute single-pole circuit breakers with handle ties for multi-pole breakers.
   2. Do not use tandem or dual circuit breakers in normal single-pole spaces.
   3. Do not use three-pole devices for the protection of two-pole or single-pole circuits.

E. Specialty Breakers: Where indicated, provide breakers with the following features:
   1. Ground Fault Circuit Interrupter (GFCI): Rated to trip on 4 mA to 6 mA ground fault within 0.025 second (UL 943, Class A sensitivity, for protection of personnel). Ground fault sensor shall be rated same as circuit breaker. Breaker shall include push-to-test and reset buttons.
   2. Equipment Ground Fault Interrupter (EGFI): Where indicated, equip breaker with ground fault sensor and rated to trip on 30-mA ground fault (UL listed for equipment ground fault protection).
   3. Arc Fault Circuit Interrupter (AFCI): Where indicated, equip breaker with arc fault sensor to detect and trip the circuit breakers when an arcing fault occurs (UL 1699 listed).
   4. Heating and Air Conditioning Rated (HACR): Where indicated, provide breaker UL listed for the protection of such equipment.
   5. Switching Duty (SWD) Rated: Where indicated, provide breaker UL listed for frequent switching of lighting and other branch circuit loads.

F. Solid State Trip Units: Where indicated, equip breakers with solid state trip units in accordance with Section 26 14 13, Low-Voltage Switchboards.
   1. Long (Time) Short (Time) Instantaneous (LSI): Electronic trip unit with fixed long-time trip, adjustable short-time trip and delay, and adjustable instantaneous trip settings.
   2. Long (Time) Short (Time) Instantaneous Ground (Fault) (LSIG): Electronic trip unit as above and also with adjustable ground fault trip and delay settings.
2.05 ENCLOSURES

A. General:
   1. Provide as specified in Section 26 05 04, Basic Electrical Materials and Methods.
   2. Type 1 Gasketed, Type 12, Type 3R, and Type 3S material code-gauge, hot-dip galvanized sheet steel with reinforced steel frame.
   3. Type 4 and Type 4X material to be Type 304 stainless steel.
   4. Provide surface-mount panelboard from trim with same dimensions as box front.

B. Finish: Rust inhibitor prime followed by manufacturer’s standard gray baked enamel or lacquer. NEMA Type 1 gasketed enclosure box may be unfinished galvanized sheet steel.

C. NEMA 250 Type 1 Branch Panelboard Enclosure:
   1. Secure front trim to box with concealed trim clamps.
   2. Overlap flush panelboards front trims with box nominal 3/4 inch on all sides.
   3. Provide door in panelboard front trim, with concealed hinges, to access protective device operating handles.
   4. Provide multi-point latching for doors over 30 inches in height.
   5. Door Lock: Secure with flush catch and tumbler lock; all panelboards keyed alike, with two milled keys each lock.
   6. Circuit Directory: Metal frame with transparent plastic face and enclosed card, mounted inside each panel door.

2.06 BUSSING AND TERMINAL BARS

A. Bus:
   1. Material: Tin-plated copper full sized throughout length.
   2. Provide for mounting of future protective devices along full length of bus regardless of number of units and spaces shown. Machine, drill, and tap as required for current and future positions.

B. Equipment Ground Terminal Bus: Copper with suitably sized provisions for termination of ground conductors and bonded to box.
   1. Provide individual mechanical termination points no less than the quantity of breaker pole positions.
   2. Provide individual termination points for all other grounding conductors such as feeder, grounding electrode, etc.
3. Termination points shall be bolted crimp compression lugs for conductors 6 AWG and larger.

C. Neutral Terminal Bus: Copper with suitably sized provisions for termination of neutral conductors, and isolated from box.
   1. Provide individual mechanical termination points no less than the quantity of breaker pole positions.
   2. Provide individual termination points for all other neutral conductors.
   3. Termination Points: Bolted crimp compression lugs for conductors 6 AWG and larger.

D. Provision for Future Devices: Equip with mounting brackets, bus connections, and necessary appurtenances for future protective device ampere ratings indicated.

2.07 SPECIAL FEATURES

A. General: Where indicated on Drawings or schedules, provide special features as specified.

B. Service Equipment Approval: Listed for use as service equipment for panelboards having service disconnecting means. Include separate panel label indicated ‘SE Rated’.

C. Subfeed Lugs: Protective device or lugs indicated, with additional terminals on neutral and ground bus to accommodate feeder.

D. Feed-Through Lugs: At opposite end of phase bus from mains, with additional terminals on neutral and ground buses, sized to accommodate feeders indicated.

E. Surge Protective Devices:
   1. As indicated on Drawings.
   2. Provide factory mounted within panelboard utilizing UL-recognized mounting device.
   3. SPD shall be as manufactured by Surge Suppression, Inc. (SSI). No exceptions or substitutions.

F. Fire Alarm Circuits: Identify all branch circuits feeding fire detection and alarm panels and equipment with a red, engraved to white core, plastic nameplate attached to the individual branch circuit breakers. Engrave nameplates with “FIRE ALARM CIRCUIT”.
PART 3 EXECUTION

3.01 GENERAL

A. Install in accordance with NECA 407, NEMA PB 1.1, and manufacturers’ written installation instructions.

B. Install securely, plumb, in-line and square with walls.

C. Install top of cabinet trim 78 inches above floor, unless otherwise shown. Install cabinet so tops of protective device operating handles are no more than 78 inches above the floor.

D. Ground Fault Protection: Install panelboard ground fault circuit interrupter devices in accordance with installation guidelines of NEMA 289.

E. Install filler plates in unused spaces.

F. Wiring in Panel Gutters: Train conductors neatly in groups; bundle and wrap with nylon wire ties.

G. Mount flush panels uniformly flush with wall finish.

H. Provide typewritten circuit directory for each panelboard.

I. Provide engraved identification for each protective device.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

2. Federal Specifications (FS):
   b. W-S-896F, Switches, Toggle (Toggle and Lock), Flush Mounted (General Specification).
3. Institute of Electrical and Electronic Engineers, Inc. (IEEE):
   a. C62.41.2, Recommended Practice on Characterization of Surges in Low-Voltage (1,000V and less) AC Power Circuits.
   b. C62.45, Recommended Practice on Surge Testing for Equipment Connected to Low-Voltage (1,000V and less) AC Power Circuits.
5. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
   b. FB 11, Plugs, Receptacles, and Connectors of the Pin and Sleeve Type for Hazardous Locations.

   d. WD 6, Wiring Devices – Dimensional Specifications.
7. UL:
   b. 508, Standard for Safety for Industrial Control Equipment.
   e. 1436, Standard for Safety for Outlet Circuit Testers and Similar Indicating Devices.

1.02 SUBMITTALS

A. Action Submittals: Manufacturer’s product data for wiring devices.
PART 2 PRODUCTS

2.01 SWITCHES

A. Switch, General Purpose:

1. NEMA WD 1 and FS W-S-896F.
2. Totally enclosed, ac type, with quiet tumbler switch and screw terminal.
3. Rivetless one-piece brass or copper alloy contact arm with silver alloy contact.
4. Capable of controlling 100 percent tungsten filament, fluorescent and LED lamp loads.
6. Automatic grounding clip and integral grounding terminal on mounting strap.
7. Special Features:
   a. Provide the following features in comparable devices where indicated:
      1) Three-way and four-way.
      2) Locator, illuminated operator.
8. Manufacturers and Products, Industrial Grade:
   a. Cooper Arrow Hart; AH1220 Series.
   b. Bryant; 4901 Series.
   c. Hubbell; 1221 Series.
   d. Leviton; 1221 Series.

B. Switch, Motor Rated:

1. Type: Two-pole or three-pole, manual motor starting/disconnect switch without overload protection.
2. UL 508 listed.
3. Totally enclosed snap-action switch. Quick-make, slow-break design with silver alloy contacts.
4. Minimum General Purpose Rating: 30 amperes, 600V ac.
5. Minimum Motor Ratings:
   a. 2 hp for 120V ac, single-phase, two-pole.
   b. 3 hp for 240V ac, single-phase, two-pole.
   c. 15 hp for 480V ac, three-phase, three-pole.
6. Screw-type terminal.
7. Manufacturers and Products:
   a. Cooper Arrow Hart.
   b. Hubbell Bryant; HBL78 Series.
   c. Leviton.
2.02 RECEPTACLES

A. Receptacle, General Purpose:

1. NEMA WD 1 and FS W-C-596G.
2. Duplex, two-pole, three-wire grounding type with screw type wire terminals.
3. Impact resistant nylon cover and body, with finder grooves in face, unless otherwise indicated.
4. One-piece mounting strap with integral ground contact (rivetless construction).
5. Contact Arrangement: Contact to be made on two sides of each inserted blade without detent.
6. Rating: 125 volts, NEMA WD 1, Configuration 5-20R, 20 amps unless otherwise indicated.
7. Size: For 2-inch by 4-inch outlet box.
8. Special Features:
   a. Provide the following features in comparable devices where indicated:
      1) Listed weather-resistant per NEC 406.8 for installation in damp or wet locations.
      2) Listed Class A, 4 mA to 6 mA GFCI. See Paragraph Receptacle, Ground Fault Circuit Interrupter below.
9. Industrial Grade Manufacturers and Products:
   a. Cooper Arrow Hart; 5362 Series.
   b. Hubbell Bryant; HBL5362 Series.
   c. Leviton; 5362 Series.

B. Receptacle, Ground Fault Circuit Interrupter:

1. Meet requirements of general-purpose receptacle.
2. Listed Class A to UL 943, tripping at 4 mA to 6 mA.
3. Rectangular smooth face with push-to-test and reset buttons.
4. Listed weather-resistant per NEC 406.8 when installed in damp or wet locations.
5. Feed-through Capability: 20 amps.
6. Manufacturers and Products:
   a. Hubbell Bryant; GFTR20 Series.
   b. Cooper Arrow Hart WRVGF20 Series.
   c. Leviton; 7899 Series.

C. Receptacle, Special-Purpose: Rating and number of poles as indicated or required for anticipated purpose. As indicated on Drawings.
2.03 TELEPHONE AND DATA JACK

A. Compatible with Category 6 cable, and backwards compatible with Category 5 and Category 5e.
   1. High-impact thermoplastic body.
   2. Termination Type:
      a. IDC with pair separation towers.
      b. Compatible with 110-style termination tool.
   3. Snap-on cap to secure connections.
   4. Listed UL 1863.
   5. Manufacturers and Products:
      a. Hubbell; HXJ6 Series.
      b. Leviton; 61110 Series.

2.04 DEVICE PLATES

A. Sectional type plate not permitted.

B. Nylon:
   1. Material: Specification grade, 0.10-inch minimum thickness, noncombustible, thermosetting.
   2. Color: To match associated wiring device.
   3. Mounting Screw: Oval-head metal, color matched to plate.

C. Stainless Steel:
   1. Material: Specification grade, one-piece, 0.040-inch nominal thickness stainless steel.
   3. Mounting Screw: Oval-head, finish matched to plate.

D. Cast Metal:
   1. Material: Copper-free aluminum.
   2. Screw: Oval-head stainless steel.

E. Weatherproof:
   1. Receptacle, Weatherproof Type 1:
      a. Gasketed, cast-aluminum, with individual cap over each receptacle opening.
      b. Mounting Screw and Cap Spring: Stainless steel.
c. Manufacturers and Products:
   1) Crouse-Hinds; Type WLRD-1.
   2) Appleton; Type FSK-WRD.

2. Receptacle, Weatherproof Type 2:
   a. UL listed for wet location while in use.
   b. Die cast metal cover.
   c. Locking type.
   d. Manufacturer and Product: TayMac; Type Multi-Mac.

3. Switch:
   a. Gasketed, cast-metal or cast-aluminum, incorporating external operator for internal switch.
   b. Mounting Screw: Stainless steel.
   c. Manufacturers and Products:
      1) Crouse-Hinds; DS-181 or DS-185.
      2) Appleton; FSK-1VTS or FSK-1VS.

2.05 FINISHES

A. Wiring device catalog numbers specified in this section do not designate device color. Unless otherwise indicated, or required by code, provide colors as specified below, or as required by Drawings.

B. Wiring Device:
   1. All Areas: Grey.

PART 3 EXECUTION

3.01 INSTALLATION, GENERAL

A. Comply with NECA 1.

B. Coordination with Other Trades:
   1. Ensure device and its box are protected. Do not place wall finish materials over device box and do not cut holes for box with router that is guided by riding against outside of box.
   2. Keep outlet box free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate raceway system, conductors, and cables.
   3. Install device box in brick or block wall such that cover plate does not cross a joint, unless otherwise indicated. Where indicated or directed to cross joint, trowel joint flush with face of wall.
   4. Install wiring device after wall preparation, including painting, is complete.
C. Conductors:

1. Do not strip insulation from conductors until just before they are spliced or terminated on devices.
2. Strip insulation evenly around conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
3. Length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.

D. Device Installation:

1. Replace devices that have been in temporary use during construction or that show signs they were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until last possible moment.
4. Connect devices to branch circuits using pigtails that are not less than 6 inches (150 mm) in length.
5. Use torque screwdriver when a torque is recommended or required by manufacturer.
6. When conductors larger than 12 AWG are installed on 15-amp or 20-amp circuits, splice 12 AWG pigtails for device connections.
7. Tighten unused terminal screws on device.
8. Device Plates:
   a. Do not use oversized or extra deep plate.
   b. Repair wall finishes and remount outlet box when standard device plate does not fit flush or does not cover rough wall opening.

3.02 SWITCH INSTALLATION

A. Switch, General Purpose:

1. Mounting Height: See Section 26 05 33, Raceway and Boxes.
2. Install with switch operation in vertical position.
3. Install single-pole, two-way switch such that toggle is in up position when switch is on.

B. Switch, Motor Rated:

1. Mounting Height: See Section 26 05 33, Raceway and Boxes.
2. Install with switch operation in vertical position such that toggle is in up position when ON.
3. Install within sight of motor when used as disconnect switch.
3.03 RECEPTACLE INSTALLATION

A. Duplex Receptacle:
   1. Install with grounding slot up, except where horizontal mounting is shown, in which case install with neutral slot up.
   2. Ground receptacle to box with grounding wire only.
   3. Weatherproof Receptacle:
      a. Install in cast metal box.
      b. Install such that hinge for protective cover is above receptacle opening.
   4. Ground Fault Interrupter: Install feed-through model at locations where ground fault protection is specified for “downstream” conventional receptacles.
   5. Special-Purpose Receptacle: Install in accordance with manufacturer’s instructions.

3.04 DEVICE PLATE INSTALLATION

A. Securely fasten to wiring device; ensure tight fit to box.

B. Flush Mounted: Install with all four edges in continuous contact with finished wall surface without use of mat or similar material. Plaster fillings will not be acceptable.

C. Surface Mounted: Plate shall not extend beyond sides of box, unless plate has no sharp corners or edges.

D. Install with alignment tolerance to box of 1/16 inch.

E. Label with Designated Title:
   1. Printed:
      a. Character Height: 1/8-inch.
      b. Text: Black.
      c. Background: White.

F. Type (Exterior):
   2. Receptacle in Damp Location: Weatherproof Type 1.
   3. Receptacle in Wet Location: Weatherproof Type 2.
ZINK DAM IMPROVEMENTS

G. Type (Interior):

1. Flush Mounted Box: Nylon or stainless steel.
2. Surface Mounted, Metal Box:
   a. General Purpose Areas (Dry): Cast metal.
   b. Other Areas: Cast metal.
3. Surface Mounted, Aluminum Box:
   a. General Purpose Areas: Stamped.
   b. Other Areas: Cast metal.
4. Surface Mounted, Cast Box: Cast.
5. Surface Mounted, Nonmetallic Box: Manufacturer’s standard.
6. Receptacle Shown as Weatherproof on Drawings: Weatherproof Type 1.

3.05 IDENTIFICATION

A. Use tape labels for identification of individual wall switches and receptacles in dry indoor locations.

1. Degrease and clean device plate surface to receive tape labels.
2. Use 3/16-inch Kroy black letters on white background, unless otherwise indicated.
3. Identify panelboard and circuit number from which item is served on face of plate.

B. Identify conductors with durable wire markers or tags inside outlet boxes where more than one circuit is present.

3.06 FIELD QUALITY CONTROL

A. Perform tests and inspections, and prepare test reports.

B. Test Instrument for 125-Volt 20-Amp Receptacle: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.

C. Using test plug, verify device and its outlet box are securely mounted.

D. Line Voltage Range: 105 volts to 132 volts.

E. Percent Voltage Drop under 15-Amp Load: Less than 6 percent; 6 percent or higher is not acceptable.

F. Ground Impedance: 2 ohms, maximum.

G. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
H. Tests shall be diagnostic, indicating damaged conductors, high resistance at circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES
A. The following is a list of standards which may be referenced in this section:
   1. Lightning Protection Institute (LPI): 175, Standard of Practice.
   2. National Fire Protection Association (NFPA):
      a. 70, National Electrical Code (NEC).
      b. 780, Standard for the Installation of Lightning Protection Systems.
   3. UL:
      a. 96, Standard for Lightning Protection Components.
      b. 96A, Standard for Installation Requirements for Lightning Protection Systems.

1.02 DESIGN REQUIREMENTS
A. Provide lightning protection system design for the following structures:
   1. Air Compressor/PSO Pump Room Building on the West Bank.
   2. Site Illumination and Camera Poles on the East Bank.
B. Design lightning protection system to comply with applicable provisions of LPI 175, UL 96, UL 96A, and NFPA 780.

1.03 SUBMITTALS
A. Action Submittals:
   1. Reproducible Drawings, signed and sealed by an Oklahoma Professional Engineer (PE):
      a. Lightning protection system layout.
      b. Component locations.
      c. Detailed plans.
   2. Down conductor.
   3. Connecting conductor.
   4. Bond strap.
   5. Air terminals.
   6. Fittings.
   7. Connectors.
   8. Ground rods.
B. Informational Submittals:

1. Field test report.
2. Ground Witness Certification-Form LPI-175A.
3. Post-Installation Certification-Form LPI-175B.
4. UL 96 Master Label Certification for the complete, installed system.

1.04 QUALITY ASSURANCE

A. Designer: Lightning protection system design shall be prepared by an LPI-certified designer, or recognized lightning protection manufacturer, signed and sealed by an Oklahoma Professional Engineer (PE).

B. System components shall be the product of a manufacturer regularly engaged in the manufacturing of lightning protection components in accordance with UL 96.

C. Lightning protection system shall be installed under direct supervision of an LPI 175 Certified Master Installer.

D. Inspection of final installation and grounding connection shall be performed by an LPI-certified inspector.

E. Provide the Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by Authority Having Jurisdiction (AHJ), material and equipment shall be labeled or listed by a nationally recognized testing laboratory (NRTL) or other organization acceptable to the AHJ in order to provide a basis for approval under NEC.

F. Materials and equipment manufactured within the scope of standards published by UL shall conform to those standards and shall have an applied NRTL Listing or Labeling mark.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. Thompson Lightning.
2. IPC Protection.
4. VFC, Inc.
5. Robbins Lightning, Inc.
2.02 GENERAL

A. Complete system shall bear UL 96 Master Label Certification.

B. Power system surge protection is provided under other sections of these Specifications.

C. System Material: Copper or high copper content, heavy-duty bronze castings, or aluminum, unless otherwise specified.

D. Material shall comply in weight, size, and composition for the class of structure to be protected as established by NFPA 780.

2.03 COMPONENTS

A. Air Terminal:
   1. Material: Solid aluminum with tapered or blunt points as required for application.
   2. Length: Sufficient to extend minimum 10 inches above object being protected.
   3. UL 96 Label B applied to each terminal.

B. Conductors:
   1. Lightning System Conductors: Bare medium hard-drawn stranded copper, or stranded aluminum as required for the application.
   3. Connecting Conductor: Concentric stranding.
   5. Main down and connecting conductors shall bear the UL 96 Label A, applied every 10 feet.

C. Cable Fastener and Accessories: Capable of withstanding minimum pull of 100 pounds.

D. Fittings:
   1. Heavy-duty.

E. Ground Rods: As specified in Section 26 05 26, Grounding and Bonding for Electrical Systems.
PART 3 EXECUTION

3.01 GENERAL

A. Workmanship to comply with all applicable provisions of LPI 175, UL 96, UL 96A, and NFPA 780.

B. Aluminum materials shall be used where required to meet the galvanic corrosion requirements of UL 96A.

C. Provide pitchpockets or method compatible with roofing to waterproof roof penetrations.

D. Install system in inconspicuous manner so components blend with building aesthetics.

3.02 EXAMINATION

A. Verify conditions prior to installation. Actual conditions may require adjustments in air terminal and ground rod locations.

3.03 INSTALLATION

A. Air Terminals:

1. Supports: Brackets or braces.
2. Parapet Bracket Attachment: Lag or expansion bolts.
3. Secure base to roof surface with adhesive or pitch compatible with roofing bond.
4. Provide terminal flashing at roof penetrations.
5. Perimeter Terminals:
   a. Maximum Spacing: 20 feet.
   b. Maximum Distance From Outside Edge of Building: 2 feet.
6. Roof Ridge Terminals: Maximum spacing 20 feet.
7. Mid-Roof Terminals: Maximum spacing 50 feet.
8. Provide blunt point air terminals for applications exposed to personnel.
B. Conductors:

1. Conceal whenever practical.
2. Provide 1-inch PVC conduit in building walls or columns for main downleads and roof risers.
   a. Vertical: 3-foot.
   b. Horizontal: 4-foot.
4. Maintain horizontal and vertical conductor courses free from dips or pockets.
5. Bends: Maximum 90 degrees, with minimum 8-inch radius.
6. Install air terminal conductors on the structural roof surface before roofing composition is applied.

C. Bonding:

1. Bond to Main Conductor System:
   a. Roof-mounted ventilators, fans, air handlers, masts, flues, cooling towers, handrails, and other sizeable metal objects.
   b. Roof flashing, gravel stops, insulation vents, ridge vents, roof drains, soil pipe vents, and other small metal objects if located within 6 feet of main conductors or another grounded object.
2. Bond each steel column or major framing members to grounding system.
3. Bond each main down conductor to grounding system.

D. Grounding Electrode System: Bond all down conductors to the building’s grounding electrode system as shown on Drawings. Design of the grounding electrode system is responsibility of Owner’s Engineer and shall provide a maximum resistance to remote earth 5 ohms.

3.04 FIELD QUALITY CONTROL

A. Field Testing:

1. Coordinate with the requirements of Section 26 05 26, Grounding and Bonding for Electrical Systems.
2. Isolate lightning protection system from other ground conditions while performing tests.
3. Resistance: Test ground resistance to remote earth after power system is energized and with utility neutral connected. Testing shall utilize a clamp-on ground resistance meter such as AEMC 3711, Fluke 1630, Greenlee CMGRT-100, or equivalent device. Ground resistance meter must have a current certificate of calibration not exceeding 12 months at time of installation testing. Fall-of-Potential testing is not acceptable.
   a. Test shall be conducted on the grounding electrode conductor of the service-entrance equipment.
   b. Resistance to Remote Earth: Maximum 5 ohms.
   c. Contact Owner’s Engineer for remediation solutions should measurement exceed the maximum value allowed.

4. Test Report:
   a. Description of equipment tested.
   b. Description of test.
   c. Test results.
   d. Conclusions and recommendations.
   e. Appendix, including appropriate test forms.
   f. Identification of test equipment used.
   g. Signature of responsible test organization authority.

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. General:
      1) Provide catalog data sheets and pictures for all products.
      2) Proposed Luminaire Substitutions (Interior and Exterior):
         Provide an electronic photometric file in standard ‘.ies’ file format per the Illumination Engineering Society of North America (IESNA) for any proposed luminaire substitution not identified on the project Luminaire Schedule. Obtain file from the luminaire manufacturer or approved independent photometric testing laboratory. Include the proposed substitute luminaire with all options identified on the project Luminaire Schedule.
b. Interior Luminaires:
   1) Catalog data sheets with pictures.
   2) Luminaire material, finish, dimensions, and metal gauge.
   3) Lens material, pattern, and thickness.
   4) Candle power distribution curves in two or more planes.
   5) Candle power chart 0 degree to 90 degrees.
   6) Lumen output chart.
   7) Average maximum brightness data in foot lamberts.
   8) Coefficients of utilization for zonal cavity calculations.
   9) Mounting or suspension details.

c. Exterior Luminaires:
   1) Catalog data sheets with pictures. Luminaire material, finish, dimensions, and metal gauge.
   2) Lens material, pattern, and thickness. Filters.
   3) IESNA lighting classification (BUG rating).
   4) Isolux diagram.
   5) Lighting distribution data and lighting distribution classification type as defined in IESNA HB 9.
   6) Fastening details to wall, pendant, or pole.
   7) Ballast type, location, and method of fastening.
   8) For light poles, submit catalog sheet, wind loading, pole deflection with fixture attached, total weight, all accessories, complete dimensions, and finish.
   9) Brackets and supports.

d. Lamps:
   1) Voltages.
   2) Watts.
   3) Correlated Color Temperature (CCT).
   4) Color Rendering Index (CRI).
   5) Published rated life (in hours). Provide number of hours per start and operating temperature for published rated life hours indicated.
   6) Published rated initial and mean lumens.
   7) Lumen maintenance curve.
   8) Lamp type (ANSI designation, dimensions, shape, and base).

e. Ballasts:
   1) Type.
   2) Wiring diagram.
   3) Ballast factor.
   4) Nominal watts and input watts.
   5) Input voltage and power factor.
   6) Starting current, line current, and restrike current values.
   7) Sound rating.
   8) Temperature rating.
9) Efficiency ratings.
10) Low temperature characteristics.
11) Emergency Ballasts:
   a) Electrical ratings.
   b) Lamp type compatibility.
   c) Battery capacity.

f. LED Source Systems:
   1) General:
      a) IESNA LM-80 test reports.
      b) IESNA TM-21 ratings.
      c) Operating temperature range. Data sheet (chart/graph) describing life as a function of temperature.
      d) Warranty: Light engine and driver.
      e) Rated life.
      f) Surge protection.
      g) Thermal control device, heat sink.
      h) Enclosure and wiring information.
      i) Operating voltage range.

   2) Electronic Module/Light Engine:
      a) Correlated Color Temperature (CCT).
      b) Color Rendering Index (CRI).

   3) Drivers:
      a) Input Current Total Harmonic Distortion.
      b) Power factor.
      c) Sound rating.

g. Time Switches:
   1) Wiring diagram.
   2) Contact ratings.
   3) Functional features.
   4) Programmable capabilities.
   5) Enclosure type, dimensions.

h. Lighting Contactor:
   1) Type (mechanically or electrically held).
   2) Enclosure.
   3) Contact ratings and configuration.
   4) Coil operating voltage.

i. Photoelectric Switches (Photocells):
   1) Voltage.
   2) Power consumption.
   3) Load capacity (watts).
   4) Contact ratings and configuration.
   5) Time delay.
   6) Light operating level controls.
   7) Enclosure type and dimensions.
   8) Mounting type.
9) Temperature range.
10) Features and options.

j. Landscape Lighting:
   1) Luminaires.
   2) Controls.
   3) Transformers.
   4) Wiring.

k. Seismic anchorage and bracing drawings and cut sheets, as required by Section 26 05 02, Basic Electrical Requirements.

B. Informational Submittals:

   1. Anchorage and bracing calculations as required by Section 26 05 02, Basic Electrical Requirements.
   2. Manufacturer’s printed installation instructions.
   3. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.

1.03 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

   1. Provide Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, provide material and equipment labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ to provide a basis for approval under NEC.
   2. Provide materials and equipment manufactured within the scope of standards published by UL in conformance with those standards and with an applied NRTL Listing or Labeling mark.

B. Standard Products:

   1. Provide materials and equipment of manufacturers regularly engaged in the production of products specified in this section and that are of equal material, design, and workmanship.
   2. Provide products that have been in satisfactory commercial or industrial use for 2 years prior to Bid opening in similar applications under similar circumstances and of similar size. Provide products that have been on sale on the commercial market through advertisements, manufacturers’ catalogs, or brochures during the 2-year period.
   3. Material and Equipment Manufacturing Date: Do not use products manufactured more than 3 years prior to date of delivery to Site.
1.04 DELIVERY, STORAGE, AND HANDLING

A. Aluminum Poles:
   1. Provide manufacturer’s standard protection for the finish during shipment and installation. At minimum, spirally wrap each pole shaft with protective paper secured with tape, and ship small parts in boxes.
   2. Do not store poles on ground.
   3. Support poles so they are at least 1 foot above ground level and growing vegetation.
   4. Do not remove factory-applied pole wrappings until just before installing pole.
   5. Ship poles with bolt circle template, base cover, handhold cover, and shaft cap or tenon.

1.05 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following spare parts, special tools, and materials:

<table>
<thead>
<tr>
<th>Item</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spare ballast of each type</td>
<td>Two complete sets</td>
</tr>
<tr>
<td>Spare lamps of each type</td>
<td>One complete set</td>
</tr>
<tr>
<td>Spare LED drivers of each type</td>
<td>Two complete sets</td>
</tr>
</tbody>
</table>

PART 2 PRODUCTS

2.01 LUMINAIREs

A. General: For exterior illumination associated with the East Bank, see Section 26 56 00, Exterior Lighting.

B. Specific requirements relative to execution of the Work of this section are located in Luminaire Schedule as shown on Drawings.

C. Provide luminaires and components tested, listed, and labeled by a NRTL.

D. Provide luminaires with Illumination Engineering Society of North America (IESNA) formatted photometric files, “.ies” format, certified by the luminaire manufacturer for use with lighting software.
E. Luminaire Labels:
   1. External label per ANSI C136.15.
   2. Internal label per ANSI C136.22.

F. Provide luminaires rated by the manufacturer to start and operate to their full lumen capacity for rated life of the luminaire at the minimum low and maximum high ambient temperatures as defined in the Contract Documents at their installation location.

G. Feed-through type.

H. Wire Leads: Minimum 18 AWG.

I. Component Access: Accessible and replaceable without removing luminaire from ceiling, wall or pole.

J. Exterior Installations:
   1. NRTL Labeled: WET LOCATIONS.
   3. When factory-installed photocells are provided, entire assembly shall have a NRTL label.

K. Illuminated Exit Signs:
   1. Body: As scheduled.
   2. Face: Stencil.
      a. Letters:
         1) 6-inch high by 3/4-inch stroke.
         2) Color: Red.
   4. Directional Arrows: As shown on Drawings.

L. Emergency Lighting Units:
   1. Power Pack: Self-contained, 120/277-volt dual voltage transformer, inverter/charger, sealed nickel cadmium battery, and indicator switch in accordance with UL 924.
   2. Lighted, push-to-test indicator.
   3. Capable of providing full illumination for 1-1/2 hours in emergency mode.
   4. Capable of full recharge in 24 hours, automatically upon resumption of normal line voltage.
   5. Capable of protecting against excess charging and discharging.
6. Emergency Self-Diagnostic System:
   a. Solid state device with LED display and audible alarm.
   b. Automatic and manual test unit.
   c. Test for malfunction of lamps, battery, and charger board.

2.02 LED SOURCE SYSTEMS

A. General:
   1. Provide IESNA LM-80 test reports.
   2. Provide Energy Star compliance for solid state luminaires.
   4. Provide RoHS compliant LED light source(s) and driver(s).
   5. Rated operating temperature range as indicated on the Luminaire Schedule.
   6. Warranty: 5 years minimum.

B. Electronic Module/Light Engine:
   1. Mount all components to a single plate and factory prewired with quick-disconnect plugs.
   2. Include a driver, thermal control device, thermal protector device, and surge protector device.
      a. Provide surge protector tested in accordance with IEEE/ANSI C62.41.2 to Category C Low.
   3. Provide LEDs mounted to a metal-core circuit board and aluminum heat sink for optimal thermal management and long life.
   4. Light Engine Rating per TM-21: 60,000 at 65 degrees C, L84.
   5. Correlated Color Temperature (CCT): As indicated on the Luminaire Schedule.

C. Drivers:
   1. Expected life of 60,000 hours at 65 degrees C.
   2. Provide drivers mounted in an all metal can.
   3. Operating Voltage Range: 50/60-Hz input source, voltage range as indicated on the Luminaire Schedule with sustained variations of plus or minus 10 percent voltage with no damage to the driver.
   4. Input Current Total Harmonic Distortion: Less than 20 percent up to 50 percent of full load rating.
   5. Power Factor: Greater than 0.90 for primary application up to 50 percent of full load rating.
   6. Sound rating: Class A.
   7. Comply with NEMA 410 for inrush current limits.
2.03 LIGHTING CONTROL

A. For exterior site illumination associated with the East Bank, see Section 26 09 23, Network Lighting Controls.

2.04 POLES

A. General: As shown on Drawings.

2.05 BRACKETS AND SUPPORTS

A. Features:

1. Not less than 1-1/4-inch aluminum secured to pole.
2. Slip-fitter or pipe-threaded brackets may be used, but coordinate brackets to luminaires provided. Provide identical brackets for use with one type of luminaire unless otherwise approved by Engineer.
3. Select brackets for pole-mounted street lights to correctly position luminaire no lower than mounting height indicated.
4. Mount brackets not less than 24 feet above street.
5. Provide special mountings or brackets as shown on Drawings fabricated of metal which will not promote galvanic reaction with luminaire head.

2.06 POLE FOUNDATIONS

A. General: As shown on Drawings.

B. Anchor Bolts: Steel rod having a minimum yield strength of 50,000 psi; at minimum, galvanize the top 12 inches of the rod.

C. Concrete: As specified in Section 03 30 00, Cast-in-Place Concrete.

2.07 EMERGENCY BALLAST

A. In accordance with UL 924.

B. Nickel cadmium battery, charger, and electronic circuitry in metal case.

C. Solid state charging indicator monitoring light and double-pole test switch.

D. Manufacturers and Products:

1. MagneTek Lighting Products.
2. Philips-Bodine.
3. Hubbell Lighting; Dual-Lite.
4. Lithonia.
2.08 EQUIPMENT IDENTIFICATION

A. Manufacturer’s Nameplate: Provide each item of equipment with a nameplate bearing manufacturer’s name, address, model number, and serial number securely affixed in a conspicuous place; nameplate of distributing agent will not be acceptable.

B. Provide clear markings located to be readily visible to service personnel.

2.09 FACTORY FINISH

A. Provide electrical equipment with factory-applied painting systems that, at minimum, meet the requirements of NEMA 250 corrosion-resistance test.

PART 3 EXECUTION

3.01 LUMINAIRES

A. General:

1. Install in accordance with manufacturer’s recommendations.
2. Provide proper hangers, pendants, and canopies as necessary for complete installation.
3. Provide additional ceiling bracing, hanger supports, and other structural reinforcements to building required to safely mount.
4. Install plumb and level.
5. Install each luminaire outlet box with galvanized stud.

B. Mounting:

1. General: Coordinate mounting, fastening, and environmental conditions with Section 26 05 02, Basic Electrical Requirements.
2. Wall Mounted: Measure mounting heights from center of mounting plate to finished floor or finished grade, whichever is applicable.
3. Pendant Mounted:
   a. Provide swivel type hangers and canopies to match luminaires, unless otherwise noted.
   b. Space single-stem hangers on continuous-row fluorescent luminaires nominally 48 inches apart.
   c. Provide twin-stem hangers on single luminaires.
   d. Measure mounting heights from bottom of luminaire to finished floor or finished grade, whichever is applicable.
C. Finished Areas:

1. Install symmetrically with tile pattern.
2. Locate with centerlines either on centerline of tile or on joint between adjacent tile runs.
3. Install recessed luminaires tight to finished surface such that no spill light will show between ceilings and sealing rings.
4. Combustible Low Density Cellulose Fiberboard: Provide spacers and mount luminaires 1-1/2 inches from ceiling surface, or use fixtures suitable for mounting on low density ceilings.
5. Junction Boxes:
   a. Flush and Recessed Luminaires: Locate minimum 1-foot from luminaire.
   b. In concealed locations, install junction boxes to be accessible by removing luminaire.
6. Wiring and Conduit:
   a. Provide wiring of temperature rating required by luminaire.
   b. Provide flexible steel conduit.
7. Provide plaster frames when required by ceiling construction.
8. Independent Supports:
   a. Provide each recessed fluorescent luminaire with two safety chains or two No. 12 soft-annealed galvanized steel wires of length needed to secure luminaire to building structure independent of ceiling structure.
   b. Select chain or wire with tensile strength and method of fastening to structure adequate to support luminaire weight.
   c. Fasten chain or wire to each end of luminaire.

D. Unfinished Areas: Locate luminaires to avoid conflict with other building systems or blockage of luminaire light output.

1. Fixture Suspension: Provide 1/4-inch threaded steel hanger rods. Scissor type hangers not permitted.
2. Attachment to Steel Beams: Provide flanged beam clips and straight or angled hangers.

E. Building Exterior: Flush-mounted back box and concealed conduit, unless otherwise indicated.

3.02 LIGHTING CONTROL

A. Outdoor Luminaires: Photocells switch time clock ON at dusk with time clock switching lights OFF at preset time.
3.03 EMERGENCY BALLAST
A. Install battery, charger, and electronic circuitry metal case inside fluorescent fixture housing.
B. Install monitoring light and double-pole switch adjacent to light fixture.
C. Wire in accordance with manufacturer’s wiring diagrams.

3.04 EMERGENCY LIGHTING UNIT
A. Install in accordance with manufacturer’s recommendations.
B. Provide permanent circuit connections with conduit and wire.
C. Connect to branch circuit feeding normal lighting in area ahead of all local switches.
D. Provide separate circuit wiring to luminaire.

3.05 POLES
A. Electrical Installations: Conform to IEEE C2 and requirements specified herein.
B. Pole Setting:
   1. Depth: As shown on Drawings or footing detail.
   2. Install poles in straight runs in a straight line.
C. Aluminum Poles: Install according to pole manufacturer's instructions.
   1. Provide cast-in-place concrete base.
D. Grounding: Ground noncurrent-carrying parts of equipment including metal poles, luminaires, mounting arms, brackets, and metallic enclosures as specified in Section 26 05 26, Grounding and Bonding for Electrical Systems. Where copper grounding conductor is connected to a metal other than copper, provide specially treated or lined connectors suitable for this purpose.

3.06 FIELD FINISHES
A. Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Paint as specified on Drawings.
3.07 FIELD QUALITY CONTROL

A. Upon completion of installation, verify equipment is properly installed, connected, and adjusted. Conduct an operating test to show equipment operates in accordance with the requirements of this section.

B. Coordinate lighting and controls installation and testing with commissioning as specified in Section 01 91 14, Equipment Testing and Facility Startup.

3.08 CLEANING

A. Remove labels and markings, except NRTL Listing mark.

B. Wipe luminaires inside and out to remove construction dust.

C. Clean luminaire plastic lenses with antistatic cleaners only.

D. Touch up painted surfaces of luminaires and poles with matching paint ordered from manufacturer.

E. Replace defective lamps at time of Substantial Completion.

END OF SECTION
 PART1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, and Division 01, General Requirements Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes light fixtures, lamps and ballasts requirements for the following:

1. Exterior Lighting Fixtures, with Lamps, and Ballasts: Light Emitting Diodes (LEDs).
2. Lighting fixture supports.

1.03 DEFINITIONS

A. CCT: Correlated color temperature.
B. CRI: Color-rendering index.
C. LER: Luminaire efficacy rating.
D. Lumen: Measured output of lamp and luminaire, or both.
E. Luminaire: Complete lighting fixture, including ballast housing if provided.

1.04 REFERENCES

A. The following is a list of standards which may be referenced in this Section:

4. **EPACT:**

8. **Illuminating Engineering Society of North America (IESNA).**

9. **National Equipment Manufacturers Association (NEMA):**
   a. WD6, Wiring devices – Dimensional requirements.
   b. LE4, Recessed luminaires: ceiling compatibility.
   c. FA 1, Outdoor floodlighting equipment.
   d. OD 3, Physical and electrical interchangeability of photo control devices and mating receptacles.
   e. SH 5, Tubular steel poles.

10. **National Fire Protection Association (NFPA):**
    a. 70, National Electric Code.

11. **Occupation Safety and Health Administration (OSHA).**

12. **UL:**
    a. 57, Electric Lighting Fixtures.
    b. 924, Emergency Lighting and Power Equipment.
    c. 1598, Luminaires.

13. **WDMA:**
    a. T.M. 1, Soil Block Test.
    b. T.M. 2, Swellometer Test, Test Method to Determine the Water-Repellent Effectiveness of Treating Formulations.

1.05 **SUBMITTALS**

A. **Product Data:**

1. For each luminaire and support component, arranged in order of lighting unit designation. Submit manufacturer’s data on features, accessories, finishes, and the following, in reproducible form:
   a. Physical description of luminaire, including materials, dimensions, effective projected area, and verification of indicated parameters. Submit dimensioned drawings of lighting fixtures.
   b. Details of attaching luminaires and accessories.
   c. Details of installation and construction.
   d. Luminaire materials.
   e. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.
f. Poles and standards dimensions details of hand holes and wire entries, mast or bracket arms and connection to poles, wind load and deflection, and finishes.

g. Steel, power installed type of pole, foundation dimensions, corrosion resistance, pullout and overturning resistance for the soil conditions of the site and bolt circle data.

B. Photometric Data:

1. Supply complete photometric data for each fixture, photometric reports shall be rendered by an independent testing laboratory developed according to methods of the Illuminating Engineering Society of North America (IESNA) as follows:
   a. Luminaire description and dimensions.
   b. Candela distribution data, presented graphically and numerically in no more than 5-degree increments (5, 10, 15, etc.). Data developed for up and down quadrants normal, parallel and at 22.5, 45, 167.5 degrees to fixture axis if light output is asymmetric. Photoelectric relays.
   c. Zonal lumens stated numerically in 10-degree increments (5, 15, etc.) and fixture efficiency.
   d. Luminance table with data presented numerically, showing maximum luminance of the fixture at the shielding angles. Readings should be taken both crosswise and lengthwise in the case of LED fixtures or fixtures with asymmetric distribution.
   e. Coefficients of utilization table.
   f. Photometric Data for LED Luminaire: See also Article Solid State Lighting (LED) Fixtures.
   g. Driver UL listing, volts, lamp and line amperes, input watts and minimum lamp starting temperature.
   h. Lamp ANSI designation, initial and mean lumen output, average rated hours of lamp life and lamp mortality curve, color temperature and color rendering index.

C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
2. Design calculations, certified by a qualified professional engineer, indicating strength of screw foundations and soil conditions on which they are based.
3. Wiring Diagrams: For power, signal, and control wiring.
4. Warranty: Sample of special warranty (see Article Warranty).
D. Submittals or shop drawings lacking sufficient detail to indicate clear and complete compliance with Contract Documents shall be rejected. Include plans, elevations, sections, details, and attachments to other work.

E. Installation instructions.

F. Coordination Drawings:
   1. Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
      a. Lighting fixtures.
      b. Suspended ceiling components.
      c. Structural members to which suspension systems for lighting fixtures will be attached.
      d. Other items in finished ceiling may include the following:
          1) Air outlets and inlets.
          2) Speakers.
          3) Sprinklers.
          4) Smoke and fire detectors.
          5) Occupancy sensors.

G. Qualification Data: For qualified agencies providing photometric data for lighting fixtures.

H. Field quality-control reports.

I. Operation and Maintenance Data:
   1. For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals. Provide a collection of manufacturer recommended maintenance practices for each lighting fixture type including, but not limited to:
      a. Tools required.
      b. Acceptable cleaners and recommended cleaning practices.
      c. Replacement parts list.
      d. Manufacturer service department contact information/Qualified Service Agencies.
      e. Submittal Data.
      f. Operation Data.
      g. Intended Operation Narrative.

J. Warranty: Sample of special warranty.
K. "Approved Equal" specification status does not and shall not exempt the identified manufacturers from full and complete compliance with all criteria identified either in the specifications or as attributed to "prime specification" equipment with regards to photometric performance, brightness control, nominal size, finishes, credentials or experience, etc. Consideration, acceptance or rejection of any proposed submittal at any time shall rest solely upon the evaluation of the Lighting Designer/Engineer for those areas within the Project scope.

1.06 QUALITY ASSURANCE

A. All lighting fixtures shall be manufactured, furnished, and installed in compliance with all government agencies having jurisdiction. All fixtures shall bear the appropriate UL (or ETL) identifications.

B. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910, complying with the IESNA Lighting Measurements Testing and Calculation Guides.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Manufacturers: Provide products of firms regularly engaged in the manufacture of interior and exterior lighting equipment of the types and ratings whose products have been in satisfactory use in similar service for not less than 5 years.

E. Mockups: Provide lighting fixtures for location or module mockups complete with power and control connections.

1. Obtain Owner’s approval of fixtures for mockups before starting installations.
2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
3. Approved fixtures in mockups may become part of the completed Work if undisturbed at time of final written acceptance by the Owner.
4. The Contractor shall make every effort to install all mockups to be viewed during the course of one review session. Should mockups not be ready for viewing on the scheduled mockup date, the Contractor shall be responsible for all travel rebooking fees, upcharges, and other additional fees that may occur as a result of rescheduling the mockup date.
5. Refer to Article Mockups.
F. National Electrical Manufacturers Association (NEMA): Comply with applicable requirements of NEMA LE 4, “Recessed Luminaires, Ceiling Compatibility” pertaining to recessed luminaires.

G. UL: Comply with applicable UL standards pertaining to interior and exterior lighting equipment.

H. Manufacturers listed as “prime spec,” “or-equal,” in the lighting fixture schedule shall be assumed capable of supplying the listed fixtures unless clearly written exceptions are set forth in their quotations. Any such exceptions shall immediately be brought to the attention of the Landscape Architect and the Lighting Designer. Manufacturers not listed (as prime or approved equal) must comply with the following:

1. Experience: Manufacturers shall have not less than 5 years’ experience in design and manufacturing of lighting fixtures of the type and quality shown. Submission must include a list of completed projects and dated catalogue pages or Drawings indicating length of experience.
2. Samples: Manufacturers shall submit a prototype sample of each fixture for review by the Lighting Designer. Prototype samples shall be sufficiently detailed and operational to allow evaluation of compliance with the salient features of the specification. Preliminary design or Shop Drawings shall not be accepted in place of prototype samples (see Article Samples).

1.07 COORDINATION

A. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.

1. Conform to approved Coordination Drawings.

1.08 WARRANTY

A. Special Warranty for Emergency Lighting Batteries: Manufacturer's standard form in which manufacturer of battery-powered emergency lighting unit agrees to repair or replace components of rechargeable batteries that fail in materials or workmanship within specified warranty period.

B. LED luminaires shall carry a minimum 5 years’ warranty from the date of final written acceptance by the Owner.

C. All drivers shall carry a minimum 5-year warranty from the date of final written acceptance by the Owner.
1.09 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   
   1. LED Modules/Boards: 10 for every 100 of each type and rating installed. Furnish at least two of each type.
   2. Plastic/Glass Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least two of each type.
   3. Drivers: One for every 10 of each type and rating installed. Furnish at least five of each type.
   4. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least five of each type.
   5. Complete Luminaires: One for every 20 or each type that does not have field-replaceable LEDs and/or drivers. Furnish at least one of each type that does not have field-replaceable LEDs and/or drivers.

1.10 SAMPLES

A. Upon request, the Contractor shall submit for review one representative sample for each or any lighting fixture required under this Contract. After sample acceptance, the fixture shall be sent to the project for use as a standard. In the event the submission is rejected, the fixture will be returned to the manufacturer who shall immediately make a new submission which meets the Contract requirements.

B. All substitutions shall be provided as samples for review and approval.

C. Shipping: The samples must be actual working unit of fixtures to be supplied and shall be submitted complete with specified lamp(s), 120-volt driver/transformer complete with cord and plug set and ready for hanging, energizing, and examining sample shall be shipped (prepaid) by Contractor to the Lighting Designer or as otherwise specified or directed.

1.11 MOCKUPS

A. The specific design requirements of several building conditions will mandate the necessity of full scale on site mockups prior to final authorization (release) to fabricate. The Contractor shall include as part of the Contractor’s bid provision for complete on site mockups of the following conditions:

<table>
<thead>
<tr>
<th>Type</th>
<th>Location</th>
<th>Magnitude (Extent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>L1</td>
<td>Walkway</td>
<td>1 pole + fixtures and brackets</td>
</tr>
<tr>
<td>L1A</td>
<td>Walkway</td>
<td>1 pole + fixtures and brackets</td>
</tr>
</tbody>
</table>
B. The Contractor shall make every effort to install all mockups to be viewed during the course of one review session. Should mockups not be ready for viewing on the scheduled mockup date, the Contractor shall be responsible for all travel rebooking fees, upcharges, and other additional fees that may occur as a result of rescheduling the mockup date.

1.12 DELIVERY, STORAGE AND HANDLING

A. Lighting fixtures shall be wrapped for protection during delivery, storage, and handling. Wet or damp wrapping shall be removed, and disposed of, to prevent staining finish.

B. Deliver materials in manufacturer’s original, unopened, protective packaging.

C. Store materials in original packaging in a manner to prevent soiling and physical damage, prior to installation.

D. Handle in a manner to prevent damage to finished surfaces.

E. Where possible, maintain protective covering until installation is complete and remove such coverings as part of final cleanup.

1.13 TECHNICAL AND ADMINISTRATIVE REQUIREMENTS

A. All information identified in the Contract Documents Schedules, Details, Layouts and Specifications shall be considered to form a complete and integrated Specification for Lighting Fixtures and Control Systems in the agreed upon Scope Areas. The Contractor shall be responsible for contacting the Landscape Architect/Engineer regarding the proper interpretation of all information indicated on the Lighting Fixture Schedules, Fixture Cuts, Details and Specifications.

B. The submission of a proposal by the Contractor will be construed as evidence that a careful, complete and thorough examination of the premises, existing job conditions and Contract Documents has been made and later claims for labor, materials or equipment required or for difficulties encountered, which could have been foreseen had such an examination been made, will not be recognized. It shall also constitute a representation that the Contractor has checked and verified all quantities, work and materials involved and shall take complete responsibility for any deficiencies encountered thereafter.

C. The Contractor shall be solely responsible for verifying all fixture quantities, lengths and clearances required and shall inform the Landscape Architect/Engineer of job conditions at variance with fixtures as specified or detailed which affect installation or location at the time bid submission is made.
D. The Contractor shall insure that the lighting fixture manufacturer shall keep on file and make available for review by the Landscape Architect/Engineer and the Owner complete Quality Control and Quality Assurance records for all phases of production for all lighting fixtures to be supplied under this project.

E. Upon request the Contractor shall submit for review by the Landscape Architect/Engineer and the Owner verification that he has solicited pricing from all manufacturers which have been listed as "prime spec" and "approved equal." Upon request the Contractor shall submit for review itemized (line item) unit equipment costs for all fixtures to be provided under the Scope of this Contract.

F. The Contractor shall be solely responsible for coordinating and expediting the timely procurement and delivery for all lighting equipment, lamps, drivers, and related components for the Project.

G. Specifications and Drawings are intended to convey the salient features, function and character of the fixtures only, and do not undertake to illustrate or set forth every item or detail necessary for the work. Minor details not usually indicated on Drawings nor specified, but that are necessary or normally required for the proper execution, completion, installation and operation of the fixtures, shall be included, the same as if they were herein specified or indicated on Drawings.

H. Omissions: The Owner shall not be held responsible for the omission or absence of any detail, construction feature, etc. which may be normally required in the production of the lighting fixtures. The full and complete responsibility for accurately purchasing, fabricating and installing the lighting fixtures described herein to the fulfillment of those specifications including compliance with all regulatory bodies (i.e. UL) shall rest solely with the Contractor.

1.14 INDUSTRY STANDARDS

A. Applicability of Standards: Except where more explicit or stringent requirements are written into the Contract Documents, applicable construction industry standards have the same force and effect as if found in or copied directly into the Contract Documents. Such industry standards are made a part of the Contract Documents by reference.

1. Referenced standards (standards referenced directly in the Contract Documents) take precedence over standards that are not referenced but generally recognized in the industry for applicability to the work.
2. Unreferenced standards are not directly applicable to the work, except as a general requirement of whether the work complies with recognized construction industry standards.

B. Publication Dates: Except as otherwise indicated, where compliance with an industry standard is required, comply with the latest standard in effect as of date of Contract Documents.

C. Conflicting Requirements: Where compliance with two or more standards or criteria is specified, and where these standards establish different or conflicting requirements for minimum quantities or performance quality levels, the most stringent requirement will be enforced, and henceforth provided by the Contractor unless the Contract Documents or the Owner specifically indicates otherwise. Refer requirements that are different, but apparently equal, and uncertainties as to which quality level is more stringent, to the Landscape Architect for a decision before proceeding.

D. Minimum Quantities or Quality Levels: In every instance the quantity or quality level shown or specified is intended to be the minimum to be provided or performed. Unless otherwise indicated, the actual work may either comply exactly, within specified tolerances, with the minimum quantity or quality specified, or may exceed that minimum within reasonable limits. In complying with these requirements, the indicated numeric values are minimum or maximum values, as noted or as appropriate for the context of the requirements. Refer instances of uncertainly to the Landscape Architect/Engineer for a decision before proceeding.

E. Copies of Standards: The Contract Documents require that each entity performing work be experienced in that part of the work being performed. Each entity is also required to be familiar with industry standards applicable to that part of the work. Copies of applicable standards are not bound with the Contract Documents.

1. Where copies of standards are needed for proper performance of the work the Contractor is required to obtain such copies directly from the publication source.

2. Although copies of standards needed for enforcement of requirements may be required submittals, the Landscape Architect/Engineer reserves the right to require the Contractor to submit additional copies as necessary for enforcement of requirements.

F. Abbreviations and Names:

1. Trade association names and titles of general standards are frequently abbreviated. The following acronyms of abbreviations, as referenced in Contract Documents, are defined to mean the association names. Both
names and addresses are subject to change, and are believed to be, but are not assured to be, accurate and up-to-date, as of the date of Contract Documents:

c. ANSI, American National Standards Institute, 25 W 43rd Street, 4th Floor, New York, NY 10036, Telephone: (212) 354-3300, www.ansi.org, Fax: (212) 398-0023, in-o@ansi.org.

d. ASTM, American Society for Testing and Materials, 100 Barr Harbor Drive, PO Box C700, Telephone: (610) 832-9585, West Conshohocken, PA 19428, Fax: (610) 832-9555, www.astm.org, service@astm.org.

e. AWS, American Welding Society, 550 NW Jeune Road, Telephone: (305) 443-9353, Miami, FL 33135, Fax: (305) 443-7555, www.aws.org, info@aws.org.

g. IEEE, Institute of Electrical and Electronic Engineers, 3 Park Avenue, 17th Floor, New York, NY 10016, Telephone: (212) 419-7900, www.ieee.org, Fax: (212) 752-4929, webmaster@ieee.org.

h. IESNA, Illuminating Engineering Society of North America, 120 Wall Street, 17th Floor, New York, NY 10005-4001, Telephone: (212) 248-5000, www.iesna.org, Fax: (212) 248-5017, iesna@iesna.org.

i. NEC, National Electric Code (see NFPA).

j. NEMA, National Electrical Manufacturer's Association, 1300 N. 17th St., Suite 1847, Rosslyn, VA 22209, Telephone: (703) 841-3200, www.nema.org, Fax: (703) 841-5900, gmoniznema@verizon.net.

k. NFPA, National Fire Protection Association, 1 Batterymarch Park, Quincy, MA 02169, Telephone: (617) 770-3000, www.nfpa.org, Fax: (617) 770-0700, publicfire@nfpa.org.

G. Federal Government Agencies: Names and titles of federal government standard or specification producing agencies are frequently abbreviated. The following acronyms or abbreviations as may be referenced in the Contract Documents indicate names of standard specification producing agencies of the federal government. Names and addresses are subject to change but are believed to be, but are not assured to be, accurate and up-to-date as of the date of the Contract Documents.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Products: Subject to compliance with requirements, provide product indicated on Drawings.

B. Basis-of-Design Product: The design for each lighting fixture is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by one of the other manufacturers specified.

2.02 GENERAL REQUIREMENTS FOR LIGHTING FIXTURES AND COMPONENTS

A. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.
B. Lighting fixtures shall be of rigid construction, dimensionally stable, and shall be assembled with secure fastenings. Ferrous parts shall be protected from corrosion by plating or shall be finished with high reflectance enamel with non-yellowing binder and high pigment to binder ratio, with semi-gloss finish. Ferrous parts shall be prepared for finish by industry standard finishing process (see Finishes). Nonferrous metals (i.e. aluminum) unless otherwise noted be treated with a semi-gloss polyester powder coat enamel finish.

C. Recessed, surface or pendant lighting fixtures shall be suspended from structural members or ceiling structure members of minimum 1-1/2-inch channels, by standard bar hangers, or other approved means. Fixture locations shall be coordinated with ceiling patterns. Refer to architectural reflected ceiling plan for exact location of fixtures and architectural rooms finish schedule for ceiling construction details and mounting heights. Provide all structural steel and related supports as required or necessary to properly and safely install and support the fixtures. Conform to coordination drawings as described in Article Submittals, Paragraph Coordination Drawings.

D. Fixture wiring shall be suitable for the temperature rating of the fixture; wiring through fixture channels shall be done with Type SFF2 wire. Where a junction box is required, to change from branch circuit to fixture wiring, use approved feed through, prewired fixture wiring, and install a separate junction box. The junction box shall be fully accessible after installation of covering materials. Where flexible conduit or portable cord is used, a grounding jumper shall be installed. All fixtures shall be grounded. Housings shall be so constructed that all electrical components are easily accessible and replaceable without removing fixtures from their mountings, or disassembling adjacent construction.

E. All recessed, pendant and surface mounted lighting fixtures unless otherwise noted or directed shall be UL listed for through-wiring and shall be furnished complete with all required integral wiring and all required flexible conditions, pigtails and related accessories necessary for suitable operation and installation.

F. All materials, accessories, and other related fixture parts shall be new and free from defects which in any manner may impair their character, appearance, strength, durability and function, and be effectively protected from any damage or injury from the time of fabrication to the time of delivery and until final written acceptance of the work by the Owner.

G. Where surface mounted junction boxes are called for, the lighting manufacturer shall provide a canopy cover which completely covers the entire junction box.
H. Castings: All aluminum, iron or composite casting shall be exact replicas of the approved patterns and shall be free of sand pits, blemishes, scales and rust, and shall be smoothly furnished. Tolerance shall be provided for any shrinkage of the metal castings in order that the finished casting will accurately fit in their designated locations. Unless otherwise noted, for cast aluminum components use copper-free 319 or 443 aluminum alloy only. For cast iron components use ASTM A48-83 Class 30 gray iron.

I. Mounting Frames and Rings: If ceiling system requires, each recessed fixture shall be furnished with a mounting frame or ring compatible with the ceiling in which they are to be installed. The frames and rings shall be one piece or constructed with electrically welded butt joints and of sufficient size and strength to sustain the weight of the fixture.

J. Yokes, brackets and supplementary supporting members needed to mount lighting fixtures to carrier channels, suitable ceiling members, or other structure shall be furnished and installed by the Contractor.

K. Metal Parts: Free of burrs and sharp corners and edges. All sheet metal work shall be free from tool marks and dents.

L. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.

M. Housings: Rigidly formed, minimum No. 20 gauge cold rolled steel weather- and light-tight enclosures that will not warp, sag, or deform in use.

N. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses.

O. For steel and aluminum fixtures all screws, bolts, nuts and other fastening and latching hardware shall be cadmium or equivalent plated. For stainless steel fixtures, all hardware shall be stainless steel. Whenever possible all fasteners shall be captive type. Where indicated provide tamper resistant fasteners.

P. Welding shall be in accordance with recommendations of the American Welding Society and shall be done with electrodes and/or methods recommended by the manufacturers of the metals being welded. Welds shall be continuous, except where spot welding is specifically permitted. Welds exposed to view shall be ground flush and dressed smooth. All welds on or behind surfaces which will be exposed to view shall be done so that finished surfaces will be free of imperfections such as pits, runs, splatter, cracks,
warping, dimpling, depressions or other forms of distortion or discoloration. All welded surfaces shall be free of weld splatter and welding oxides.

Q. Extruded aluminum frame and trim shall be rigid and manufactured from 6063-T3 aluminum alloy without blemish or warpage in the installed product. Miter cuts shall be accurate. Joints shall be flush and without burrs. Cuts shall maintain alignment with the light fixture located in its final position.

R. All extruded aluminum fixtures shall be fabricated of 6063-T3 alloy (min. wall thickness 0.120) and in all cases shall be provided with heavy gauge internal alignment brackets in order to assure tight joints and a clean level and continuous appearance after installation. Unless otherwise noted, all end plates shall be continuously welded, filled and ground prior to application of final paint finishes so as to present a clean, seamless and monolithic appearance. Exposed fasteners on end plates shall be absolutely prohibited.

S. All fixtures with removable louvers, lenses, reflectors, refractors, cones or other shielding devices shall be supplied with integral safety chains. Contractor shall be responsible for insuring that all safety chains are securely fastened to shielding device and fixture housing.

T. Exposed Fasteners: All fasteners at every product and assembly exposed to view or accessible within the public’s reach shall be tamper resistant and stainless steel.

U. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

V. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:

1. White Surfaces: 92 percent.
2. Specular Surfaces: 87 percent.
3. Diffusing Specular Surfaces: 83 percent.

W. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.

X. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps and drivers. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.

1. Label shall include the following lamp and driver characteristics:
   a. "USE ONLY" and include specific lamp type.
b. CCT and CRI for all luminaires.

Y. All recessed fixtures, which are to be installed in insulated ceilings, shall be provided with UL listed thermocouple protection.

Z. Hinged door closure frames shall operate smoothly without binding. Where possible fabricate frames to allow lamp installation/removal without tools. Hinge mechanism shall be designed to preclude accidental falling of hinged door closure frames during relamping operations and while secured in operating position.

AA. Enclosures: Fabricate fixture enclosures with a minimum No. 20 gauge (0.0359 inch) thick cold rolled sheet steel. Enclosures may be constructed of other metals, provided they are equivalent in mechanical strength, durability and in compliance with local codes and acceptable for the purpose.

2.03 SOLID STATE LIGHTING (LED) FIXTURES

A. General:

1. Lighting fixtures shall conform to IES LM-79-08 and LM-80-08 standards.
2. All fixtures shall be RoHS compliant.
3. All fixtures shall conform with standards prepared by CIE, IES, UL, and other standards organizations as they apply to solid state lighting technologies. Including, but not limited to:
   a. 2-46 CIE/ISO standards on LED intensity measurements.
   b. TC2-50 Measurements of the optical properties of LED clusters and arrays.
   c. TC2-58, Measurements of LED radiance and luminance.
   d. TC2-63, Optical measurement of High-Power LEDs.
   e. TC2-64, High speed testing methods for LEDs.

B. Performance: Luminaire performance claims shall be measured in accordance with the requirements of IEC/PAS 62612: Edition 1: 2009-06. The testing quantity for LED package lamps shall be a minimum of twenty. The drive current and bin reference should be clearly documented.

1. All manufacturer data to include:
   a. Luminaire lumen output.
   b. Luminaire power.
   c. Luminaire efficacy.
   d. Correlated Color Temperature, CCT, and color shift over life.
   e. Color rendering index, and shift over life.
   f. Luminaire life including lumen depreciation and failure.
   g. Luminous intensity distribution.
2. Luminaire efficacy should be calculated from the initial lumen output of the luminaire that has reached thermal stability operating in an ambient temperature of 25 degrees C and based on the total power of the LEDs and driver circuit.

3. Definition of life shall comply with Clause 10 IEC/PAS 62612. Life shall be based on lumen depreciation and failure and shall consist of an endurance test. It shall be clearly noted which part of life and lumen depreciation has been measured and what part has been calculated or extrapolated.

4. Lumen depreciation shall be clearly document the length of time a complete LED luminaire provided more than a percentage of the rated luminous flux under standard test conditions. For illuminating luminaires the percentage shall be greater than 80 percent, indicated as L80 (greater than 80 percent). For direct view luminaires the percentage should be greater than 50 percent, indicated as L50.

5. Thermal Losses: The temperature of the p-n junction of the raw LED (die) (Tj) is to be measured at an ambient temperature of 25 degrees C. In a luminaire the die will be operating at a higher temperature. All performance parameters are to measure the Junction Temperature and Board Temperature.

6. Thermal Protection: All fixtures shall be provided with appropriate heat sink to maintain lamp life. Stated lamp life and output shall be measured and identified and documented with heat sink. Any variations from stated life or output without heat sink shall be clearly identified including Junction Temperature.

7. Warranty: Entire fixture shall carry a minimum 5-year warranty with an additional $25 per fixture labor allowance for premature failure.

C. Photometry: All fixtures shall be provided with absolute photometric tests and conducted in accordance with IES LM-79-08 Photometric Measurements of Solid State Lighting Products. Any deviations such as higher or lower drive currents or dies from other bins are to be clearly identified. Correction factors are to be provided with the results.

D. Drivers:

1. Constant Current Drivers (non-dimming): All constant current drivers shall be UL 1310, Class 2, including short-circuit protection, high-power factor, with either 12V or 24V input, unless otherwise noted. The driver shall operate on the voltage they are connected to, 120V or 277V input power. Variability in output shall not exceed 5 percent in load or 1 percent line levels. Driver shall be designed for use in minus 40 degrees C environments with a high temperature tolerance of plus 60 degrees ambient, 80 degrees C case rating. Total harmonic
distortions shall not exceed 20 percent with a current crest factor of 1.5 maximum. All drivers shall be field replaceable.

2. PWM Dimming Drivers: All PWM dimming drivers shall be UL 1310, Class 2, including short-circuit protection, high-power factor, with either 12V or 24V input, unless otherwise noted. The light output of the LED shall be controlled by DC voltage applied to the control input (0V to 10V) with a maximum of 500 micro-amps per driver. The control equipment must not impose a voltage greater than 11.0V peak maximum on the driver terminals and the short-term transient voltage must not exceed 14-volt. Control equipment intended to control more than one driver must be capable of sinking the current supplied to the control bus by the maximum number of drivers specified for the control device. The control terminals for the driver shall be isolated from the power lines and suitable for use as Class II terminals. Maximum voltage drop not to exceed 0.2 volts. Variability in output shall not exceed 5 percent in load or 1 percent line levels. Driver shall be designed for use in minus 40 degrees C environments with a high temperature tolerance of plus 60 degrees ambient, 80 degrees C case rating. Total harmonic distortions shall not exceed 20 percent with a current crest factor of 1.5 maximum. All drivers shall be field replaceable.

3. Electrical Basis of Design: 0.5 mA driver source current input; 25 mA max per control system dimming output. Any deviations that result from Contractor proposed fixture substitutions shall be brought to the Lighting Designer and Engineer’s attention. The IEC standard for current sink controls (Standard 60929 Annex E) must be followed.

E. Lamp Module:

1. All manufacturer data to include LED module information including, but not limited to:
   a. Manufacturer of the LED module with part number or other device identifier.
   b. LED module drive current, voltage, power.
   c. LED module lumen depreciation curves, life, CCT, CRI at an ambient temperature of 25 degrees C.
   d. Board temperature of the LED module installed in the luminaire with proper heat sink, when the luminaire is operating an ambient temperature of 25 degrees C.
   e. The color bin, CCT, and color shift variation of the LED module at the operating board temperature.
   f. Color rendering index at the operating board temperature.

2. LED lamp modules shall be minimum CRI of 80 with tolerances as identified in Clause 7 IEC/PAS 62612.

3. White LED modules shall be available in 2700K, 3000K, 3500K, and 4000K, or as identified in lighting fixture schedule.
2.04 LIGHTING FIXTURE SUPPORT COMPONENTS

A. Comply with Section 26 05 04, Basic Electrical Materials and Methods, for channel- and angle-iron supports and nonmetallic channel and angle supports.

B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.

C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.

E. Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 12-gauge.

F. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.

2.05 FINISHES

A. Painted surfaces shall be synthetic enamel with acrylic, alkyd, epoxy, polyester or polyurethane base, light stabilized, baked on at 350 degrees F minimum, catalytically or photo chemically polymerized after application.

B. White finishes minimum 90 percent reflectance (semi-gloss).

C. Selection: Unless otherwise indicated, all external fixture finishes shall be as selected by the Landscape Architect/Engineer. Unless otherwise indicated, all fixture finishes shall be semi-gloss polyester powder coat enamel (color to be selected by Landscape Architect).

D. Undercoat: Except for stainless steel all ferrous metal surfaces shall be given a five stage phosphate treatment or other acceptable base bonding treatment before final painting and after fabrication.

E. Unpainted nonreflecting surfaces shall be satin finished and coated with a baked-on clear lacquer to preserve the finish. Where aluminum surfaces are treated with an anodic process, the clear lacquer coating may be omitted.

F. Unpainted Aluminum Surfaces: Finish interior aluminum trims with an anodized coating of not less than 7 mg per square inch, of a color and surface finish as selected by the Landscape Architect/Engineer. Finish exterior aluminum and aluminum trims with an anodized coating of not less than
35 mg per square inch of a color and surface finish as selected by the Landscape Architect/Engineer.

G. Metal Finishes:

1. Provide finishes of the color and type indicated and having the following properties:
   a. Protection of Metal from Corrosion: 5-year warranty against perforation of the finish from weathering.
   b. Color Retention: 5-year warranty against fading, staining, or chalking from weathering including solar radiation.
   c. Uniformity: Provide finish of uniform thickness and color, free from streaks, stains or orange peel texture.

2.06 REFLECTORS

A. Reflectors, cones or baffles shall be absolutely free of spinning lines, stains, ripples or any marks or indentations caused by riveting to other assembly techniques.

1. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.

B. All fixtures with removable reflectors, louvers or baffles shall be supplied with safety chains.

C. Where stem/mounted pendant fixtures are indicated provide a minimum of three cable supports to minimize sway. Cable supports shall be stainless steel woven wire (or equivalent).

D. Cone flanges shall be formed as an integral part of the cone and shall have identical color and finish as the cone, except as shown. The flange's major surface shall be perpendicular to the cone axis.

E. The reflecting surface of the cone or reflector shall be tested for proper sealing. Test per ASTM B136-63T. If any stain is visible, the specimen shall not be considered to have been properly sealed. Reflector cones shall be free of manufactured defects. The reflector inner surface shall be free of water spotting and shall maintain a reflectivity ratio of not less than 83 percent on clear specular finish.

F. All Alzak parabolic cones shall be guaranteed by the manufacturer against discoloration for a minimum of 10 years and in the event of premature discoloration shall be replaced by the manufacturer (including both materials and the cost of labor) at no cost to the Owner.
2.07 LENSES, LOUVERS, AND DIFFUSERS

A. All lenses, diffusers, and shielding media shall be properly and securely mounted within fixture assemblies. All shielding materials shall be tightly fitted with no loose panels or parts and shall show no visible light leaks of unintentional or unscheduled light.

B. All fixtures with removable cones, louvers or other shielding devices shall be supplied with safety chains. Contractor shall be responsible for ensuring that all safety chains are securely fastened to housing and shielding device.

C. Unless otherwise indicated, all plastic shielding, lenses and diffusers shall be white opal clear 100 percent UV stabilized virgin acrylic or in special cases high impact polycarbonate (lexan). Use of polycarbonate lenses shall be restricted to those areas outlined in the National Electric Code (latest Bulletin). Use of polystyrene components is absolutely prohibited.

D. Plastic for lenses and diffusers shall be formed of colorless 100% virgin acrylic as manufactured by Rohm & Haas, DuPont, G.E. or equally acceptable manufacturers. The quality of the raw material must meet American Society of Testing Materials (ASTM) standards, as tested by an independent test laboratory. Acrylic plastic lenses and diffusers shall be properly cast, molded or extruded as specified and shall remain free of any dimensional instability, discoloration, embrittlement or loss of light transmittance for at least 15 years.

E. Unless otherwise indicated, all glass shielding, diffusers or lenses shall be clear tempered borosilicate glass. Soda lime glass material shall not be acceptable. Submit samples of glass elements upon request.

F. Glass used for lenses, refractors and diffusers lighting fixtures shall be tempered for high impact and heat resistance. Minimum transmittance equals 92 percent. For exterior fixtures use tempered borosilicate glass, Corning No. 7740, “or-equal.” For fixtures directly exposed to the elements and aimed above the horizontal with a radiant energy of 4.16 watts per square inch or greater, use Corning Vycor glass, “or-equal.”

G. Optical lenses shall be free from spherical or chromatic aberrations and other imperfections, which may hinder the functional performance of the lenses.

H. All lenses, louvers or other light diffusing elements shall be removable but positively held so that hinging or other normal motion will not cause them to drop out. Lay-in type lenses and Louvers are not acceptable.
2.08 STEMS

A. Each stem shall have a brass or steel swivel, hang straight, or other self-aligning device.

B. Wherever a fixture or its hanger canopy is applied to a surface mounted outlet box a finishing ring shall be utilized to conceal the box.

C. Unless otherwise indicated, all stems shall match in color and finish the color of the fixture which they support.

D. Stems shall be free of clamp marks, scratches and all other visual imperfections.

E. Unless otherwise indicated, stems shall be provided in order to adequately mount and level each fixture run with proper structural support per manufacturer's recommendations.

F. Install pendant lighting fixtures plumb and at a height from the floor as specified on Drawings. In cases where conditions make this impractical, refer to the Landscape Architect/Engineer for direction. Use ball aligners and canopies on pendant fixtures unless otherwise noted.

G. Space stems equally spaced every fixture run. If field conditions or fixture construction do not allow for this condition, the installing Contractor shall immediately notify the Landscape Architect/Engineer prior to commencement of the work.

2.09 MISCELLANEOUS

A. Where (or if) indicated all remote step-down transformers and drivers shall be properly wired to fixtures to ensure that voltage drop does not exceed 5 percent, regardless of transformer's or ballast's location.

B. All remote step-down transformers and drivers shall be mounted in approved NEMA type enclosures and only located in areas previously deemed to be readily accessible by the Owner’s maintenance personnel.

C. Where indicated, all uplight or wallwash coves utilizing LED equipment shall be installed so as to produce a continuous and unbroken band of light free of visual imperfections, socket shadows, light gaps, etc. The inability to provide this appearance shall be brought immediately to the Landscape Architect's/Engineer's attention prior to installation.

D. All fixture lengths whether straight or curvilinear shall be fabricated based upon the fixture manufacturer's or Contractor's field verified dimensions only.
E. Fixture manufacturer shall coordinate conduit entry locations with Installing Contractor.

2.10 POLES AND STANDARDS

A. General: Provide poles of the types and heights indicated. U.O.N., provide internal raceway for underground power supply, with luminaire support poles base indicated. Provide poles that will carry the indicated supports, luminaires and appurtenances, at the required heights above grade, without excessive deflection or whipping of the luminaire, when subjected to 100 mph winds with a 1.3 gust factor or local wind speeds/gusts, whichever is more stringent.

1. Provide Class 3 pressure treated Southern Yellow Pine, 0.60 CCA timber poles.
2. Installation: Bury 10 percent of total pole length plus an additional 2 feet.
3. Protect conduit from ground level to 10 feet up the pole or as designated by local electrical code.
4. All wood poles shall comply with all requirements as designated by ANSI O5.1-2002.

2.11 LUMINAIRE MOUNTING

A. General: Provide corrosion resistant metal luminaire mounting compatible with the poles and fixtures that will not cause galvanic action at contact points.

B. Mast Arms: Provide steel mast arm, fabricated from 3-inch pipe with span and rise as indicated, and continuously welded to pole attachment plate.

C. Brackets: Provide brackets, cantilevered and without underbrace of the sizes, styles and finishes indicated with straight tubular and section to accommodate the luminaire.

D. Pole-Top Tenon: Provide corrosion resistant steel tenon securely fastened to the top of the pole shaft fabricated to accept and rigidly support the luminaire to be mounted thereon.
PART 3  EXECUTION

3.01 INSTALLATION

A. Lighting Fixtures:
   1. Set level, plumb, and square with ceilings and walls unless otherwise indicated.
   2. Install lamps in each luminaire.

B. Temporary Lighting: If it is necessary, and approved by Owner, to use permanent luminaires for temporary lighting, install and energize the minimum number of luminaires necessary. When construction is sufficiently complete, remove the temporary luminaires, disassemble, clean thoroughly, install new lamps, and reinstall. If permanent luminaires are damaged in any way during construction, the Contractor shall be responsible for replacing said luminaires at the Contractor’s own cost.

C. The Contractor shall furnish and install lighting fixtures as noted on Drawings. Fixtures shall be completely wired and lamps installed and shall be in perfect operating condition at the time of completion.

D. Setting and Securing: The Contractor shall set lighting fixtures plumb, square, and level with ceiling and walls, in alignment with adjacent lighting fixtures, and secure in accordance with manufacturers’ directions and approved Shop Drawings. Conform to the requirements of NFPA 70.

E. Coordination: The Installing Contractor shall communicate with other trades as appropriate to properly interface, schedule and coordinate installation of lighting fixtures with other work.

F. Grounding: The Contractor shall ground noncurrent carrying parts of electrical equipment. Where the copper grounding conductor is connected to a metal other than copper, provide specially treated or lined connectors suitable for this purpose.

G. Installation of fixture locations shall be in strict accordance with the intent of the Contract Drawings and approved shop, Specifications and Drawings.

H. Instructions: Each lighting fixture shall be packaged with complete illustration and instructions showing how to install. Install lighting fixtures in strict conformance with manufacturer's recommendations and instructions.

I. The Contractor shall support all lighting fixtures independently of ductwork or piping.
J. Splices in internal wiring shall be made with approved insulated "wire nut" type mechanical connectors, suitable for the temperature and voltage conditions to which they are subjected.

K. All wire utilized for connections to or between individual lamp sockets and lamp auxiliaries (i.e., wires which do not constitute "through circuit" wiring) shall be suitable for temperature, current, and voltage conditions to which it is subjected.

L. Mounting: Mounting heights specified or indicated are to bottom of fixture for suspended and ceiling mounted fixtures and to center of fixture for wall mounted fixtures. Obtain approval of the exact mounting for lighting fixtures on the job before installation in commenced and, where applicable, after coordinating with the type, style, and pattern of the ceiling being installed.

M. Remote Mounting of Drivers: Distance between the driver and fixture shall not exceed that recommended by driver manufacturer. Verify, with driver manufacturers, maximum distance between driver and luminaire.

N. Lay-in Ceiling Lighting Fixtures Supports: Use grid as a support element.
   1. Install ceiling support system rods or wires for each fixture. Locate not more than 6 inches from lighting fixture corners.
   2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
   3. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two 3/4-inch metal channels spanning and secured to ceiling tees.
   4. Install at least one independent support rod or wire from structure to a tab on lighting fixture. Wire or rod shall have breaking strength of the weight of fixture at a safety factor of 3.

O. Suspended Lighting Fixture Support:
   1. Pendants and Rods: Where longer than 48 inches, brace to limit swinging.
   3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end.
   4. Do not use grid ductwork or piping as support for pendant luminaires. Connect support wires or rods to building structure.

P. Connect wiring according to Section 26 05 05, Conductors.
Q. Fixture locations: Do not scale electrical drawings for exact location of the lighting fixtures. In general, the Landscape Architect’s plans indicate the proper locations of lighting fixtures, unless otherwise noted on Drawings.

R. Unless otherwise shown on Drawings, lighting fixtures and/or fixture outlet boxes shall be provided with hangers to adequately support the complete weight of the lighting fixture. The design of hangers and the method of fastening other than what is shown on Drawings, or herein specified, shall be submitted to the Landscape Architect/Engineer for approval.

S. The Contractor shall provide all hangers, rods, mounting brackets, supports, frames, earthquake clips and other equipment normally required for the proper, safe and distortion-free installation in the various surfaces in which they appear. Determine surface types from the architectural drawings.

T. The Contractor shall rigidly align continuous rows of lighting fixtures for true aligned appearance.

U. The Contractor shall install reflector cones, baffles, aperture plates, light controlling elements for air handling fixtures and decorative elements after completion of ceiling tiles, painting and general cleanup.

V. The Contractor shall replace blemished, damaged, or unsatisfactory fixtures as directed by the Owners’ representative.

W. All pendant mounted lighting fixtures within the same room or area shall be installed plumb, and at a uniform height from the finished floor. Adjustment of desired height (if required) shall be made during the installation phase. Unless otherwise shown on Drawings, stems and canopies shall be matched to the associated lighting fixtures.

X. Air-Handling Lighting Fixtures: Install with dampers closed and ready for adjustment.

Y. Adjust aimable lighting fixtures to provide required light intensities.

3.02 ADJUST AND CLEAN

A. Clean: Clean lighting fixtures of dirt and debris upon completion of installation.

B. Protection: Protect installed fixtures from damage during remainder of construction period.
3.03 FIELD QUALITY CONTROL

A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.

B. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

C. Tests: Upon completion of installation of lighting fixtures, and after building circuits have been energized, apply electrical energy to demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting.

3.04 STARTUP SERVICE

A. Burn-in all lamps that require specific aging period to operate properly, prior to occupancy by Owner.

3.05 AIMING AND ADJUSTING

A. All adjustable lighting units shall be aimed, focused, locked, etc., by the Contractor under the supervision of the Lighting Designer. The Lighting Designer shall indicate the number of crews (foreman and apprentice) required. All aiming and adjusting shall be carried out after the entire installation is complete. All ladders, scaffolds, lift equipment, safety belts, flashlights, walkie talkie equipment, etc. required shall be furnished by the Contractor at the direction of the Lighting Designer. As aiming and adjusting is completed, locking set screws and bolts and nuts shall be tightened securely.

B. Night Work: Where possible, units shall be focused during the normal working day. However, where daylight interferes with seeing, aiming shall be accomplished at night.

C. Prior to final inspection, relamp all fixtures which have failed lamps, or lamps where visible color shift has occurred, and leave all lighting fixtures, equipment, and accessories in good, uniform operating condition. The Contractor shall replace any burned-out lamp during the first 100 days after the completion of the Contract.

D. Occupancy Adjustments: When requested within 12 months of date of final written acceptance by the Owner, provide on-site assistance in adjusting aimable luminaires to suit actual occupied conditions. Provide up to two visits
to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.

1. Adjust aimable luminaires in the presence of Owner/Lighting Designer.
2. As/if required, aiming shall be accomplished at night.

3.06 LUMINAIRE INSTALLATION

A. General: Install luminaires at locations and heights as indicated, in accordance with the manufacturer's written instructions, applicable requirements of NFPA 70, ANSI C2, and with recognized industry practices to ensure that lighting installation fulfills requirements.

B. Support: Fasten luminaires securely to indicated structural supports; and check to ensure that the required degree of freedom is provided to allow alignment or aiming of the fixtures for indicated light distribution.

C. Condition: Clean luminaires of dirt and debris upon completion of installation. Do not damage finishes or lens or refractor surfaces.

D. Grounding: Provide equipment grounding connections using branch circuit equipment and connected sufficiently tight to assure a permanent and effective ground.

END OF SECTION
PART 1 GENERAL

1.01 DEFINITIONS

A. Interfering or Objectionable Material: Trash, rubbish, and junk; vegetation and other organic matter, whether alive, dead, or decaying; topsoil.

B. Clearing: Removal of interfering or objectionable material lying on or protruding above ground surface.

C. Grubbing: Removal of vegetation and other organic matter including stumps, buried logs, and roots greater than 2-inch caliper to a depth of 6 inches below subgrade.

D. Scalping: Removal of sod without removing more than upper 3 inches of topsoil.

E. Stripping: Removal of topsoil remaining after applicable scalping is completed.

F. Project Limits: Areas, as shown or specified, within which Work is to be performed.

1.02 SUBMITTALS

A. Action Submittals: Drawings clearly showing clearing, grubbing, and stripping limits.

1.03 QUALITY ASSURANCE

A. Obtain Engineer’s approval of staked clearing, grubbing, and stripping limits, prior to commencing clearing, grubbing, and stripping.

1.04 SCHEDULING AND SEQUENCING

A. Prepare Site only after adequate erosion and sediment controls are in place.
PART 2  PRODUCTS (NOT USED)

PART 3  EXECUTION

3.01  GENERAL

A.  Clear, grub, and strip areas actually needed for waste disposal, borrow, or Site improvements within limits shown or specified.

B.  Do not injure or deface vegetation that is not designated for removal.

C.  Remove accumulation of river sediments, silts, muck, trash, debris, and similar materials which are deposited upon in place materials to receive site improvements.

3.02  LIMITS

A.  As follows, but not to extend beyond Project limits.

1.  Excavation: 5 feet beyond top of cut slopes.
2.  Fill:
   a.  Clearing and Grubbing: 5 feet beyond toe of permanent fill.
   b.  Stripping and Scalping: 2 feet beyond toe of permanent fill.
3.  Waste Disposal:
   a.  Clearing: 5 feet beyond perimeter.
   b.  Scalping and Stripping: Not required.
   c.  Grubbing: Around perimeter as necessary for neat finished appearance.
5.  Overhead Utilities:
   b.  Scalping and Stripping: Wherever grading is required.
6.  River and Reservoir Areas:
   a.  Clearing: 5 feet beyond perimeter of excavations, permanent fills, or structures.
   b.  Grubbing: Not required, except within excavations, permanent fills, or structures.
7.  Other Areas: As shown.

B.  Remove rubbish, trash, and junk from entire area within Project limits.
3.03 TEMPORARY REMOVAL OF INTERFERING PLANTINGS

A. Remove and store, as specified in Section 32 93 00, Planting and Fine Grading, shrubs and trees that are not designated for removal but do interfere with construction or could be damaged by construction activities.

B. Photograph and document location, orientation, and condition of each plant prior to its removal. Record sufficient information to uniquely identify each plant removed and to assure accurate replacement.

3.04 CLEARING

A. Clear areas within limits shown or specified.

B. Fell trees so that they fall away from facilities and vegetation not designated for removal.

C. Cut stumps not designated for grubbing flush with ground surface.

D. Cut off shrubs, brush, weeds, and grasses to within 2 inches of ground surface.

3.05 GRUBBING

A. Grub areas within limits shown or specified.

3.06 SCALPING

A. Do not remove sod until after clearing and grubbing is completed and resulting debris is removed.

B. Scalp areas within limits shown or specified.

3.07 STRIPPING

A. Do not remove topsoil until after scalping is completed.

B. Strip areas within limits to minimum depths shown or specified. Do not remove subsoil with topsoil.

C. Stockpile strippings, meeting the definition of Topsoil in Section 32 91 13.19, Planting Soil System Procurement, separately from other excavated material.
3.08 TREE REMOVAL OUTSIDE CLEARING LIMITS

A. Remove Within Project Limits:
   1. Dead, dying, leaning, or otherwise unsound trees that may strike and damage Project facilities in falling.
   2. Trees designated by the Owner.

B. Cut stumps off flush with ground, remove debris, and if disturbed, restore surrounding area to its original condition.

3.09 SALVAGE

A. Saleable log timber may be sold to Contractor’s benefit. Promptly remove from Project Site.

B. Sod with commercial value may be sold to Contractor’s benefit. Promptly remove from Project Site.

3.10 DISPOSAL

A. Clearing and Grubbing Debris:
   1. Dispose of debris offsite.
   2. Burning of debris onsite will not be allowed.
   3. Limit offsite disposal of clearing and grubbing debris to locations that are approved by federal, state, and local authorities, and that will not be visible from Project.

B. Scalpings: As specified for clearing and grubbing debris.

C. Strippings:
   1. Dispose of strippings that are unsuitable for topsoil or that exceed quantity required for topsoil offsite.
   2. Stockpile topsoil in sufficient quantity to meet Project needs. Dispose of excess strippings as specified for clearing and grubbing.

END OF SECTION
SECTION 31 23 13
SUBGRADE PREPARATION

PART 1 GENERAL

1.01 REFERENCES
A. The following is a list of standards which may be referenced in this section:
   1. ASTM International (ASTM):
      a. D698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lb/ft³ (600 kN-m/m³)).
      b. D1557, Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³ (2,700 kN-m/m³)).

1.02 DEFINITIONS
A. Optimum Moisture Content: As defined in Section 31 23 23, Fill and Backfill.
B. Prepared Ground Surface: Ground surface after completion of clearing and grubbing, scalping of sod, stripping of topsoil, excavation to grade, and scarification and compaction of subgrade.
C. Prepared Dam Subgrade: Bedrock surface after completion of clearing and grubbing, demolition of existing structures, removal of sediment and debris, dewater, excavation to grade.
D. Prepared Grouted Core Rock Subgrade: Bedrock surface after completion of clearing and grubbing, demolition of existing structures, removal of sediment and debris, dewatering, and excavation to grade.
E. Prepared Riprap Subgrade: Surface of existing riprap after removal of sediment and debris, vegetative growth, and other interfering or objectionable material.
F. Relative Compaction: As defined in Section 31 23 23, Fill and Backfill.
G. Relative Density: As defined in Section 31 23 23, Fill and Backfill.
H. Subgrade: Layer of existing soil after completion of clearing, grubbing, scalping of topsoil prior to placement of fill, roadway structure or base for floor slab.
I. Proof-Rolling: Testing of subgrade by compactive effort to identify areas that will not support the future loading without excessive settlement.

1.03 SEQUENCING AND SCHEDULING

A. Complete applicable Work specified in Section 02 41 00, Demolition; Section 31 10 00, Site Clearing; and Section 31 23 16, Excavation, prior to subgrade preparation.

1.04 QUALITY ASSURANCE

A. Notify Engineer when subgrade is ready for compaction or proof-rolling or whenever compaction or proof-rolling is resumed after a period of extended inactivity.

1.05 ENVIRONMENTAL REQUIREMENTS

A. Prepare subgrade when unfrozen and free of ice and snow.

B. Protect subgrade from desiccation.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Keep subgrade free of water, debris, and foreign matter during compaction or proof-rolling.

B. Bring subgrade to proper grade and cross-section and uniformly compact surface.

C. Do not use sections of prepared ground surface as haul roads. Protect prepared subgrade from traffic.

D. Maintain prepared ground surface in finished condition until next course is placed.

3.02 COMPACTION

A. Under Earthfill: Compact upper 9 inches to minimum 90 percent relative compaction as determined in accordance with ASTM D698.
B. Under Pavement Structure, Floor Slabs On Grade, Granular Fill Under Structures, 4-inch Rockfill: Compact the upper 9 inches to minimum of 98 percent relative compaction as determined in accordance with ASTM D698 within 2 percentage points of the material’s optimum moisture content.

C. Bedrock Subgrade: Not required.

D. Grouted Core Rock Subgrade: Not required.

3.03 MOISTURE CONDITIONING

A. Dry Subgrade: Add water, then mix to make moisture content uniform throughout.

B. Wet Subgrade: Aerate material by blading, discing, harrowing, or other methods, to hasten drying process.

C. Bedrock Subgrade: Keep bedrock surface moist at all times until overlying fill placement reaches 2 feet thick.

3.04 TESTING

A. Proof-roll subgrade with equipment specified in Article Compaction to detect soft or loose subgrade or unsuitable material, as determined by Engineer.

B. Coordinate bedrock subgrade inspection by Engineer or Engineer’s qualified designee.

3.05 CORRECTION

A. Soft or Loose Subgrade:
   1. Adjust moisture content and recompact, or
   2. Overexcavate as specified in Section 31 23 16, Excavation, and replace with suitable material from the excavation, as specified in Section 31 23 23, Fill and Backfill.

B. Bedrock Subgrade: If results of Engineer’s inspection of bedrock subgrade indicate that bedrock surface is unsuitable, carefully overexcavate to clean, sound, and undisturbed bedrock surface as directed by the Engineer.

C. Unsuitable Material: Overexcavate as specified in Section 31 23 16, Excavation, and replace with suitable material from the excavation, as specified in Section 31 23 23, Fill and Backfill.
3.06 DAM FOUNDATION SUBGRADE PREPARATION

A. The entirety of the Zink Dam foundation, inclusive of abutment walls, gate sections, Wave Shaper Sections and cast-in-place concrete walls which form the upstream limits of the Recreational Flume, shall bear upon undisturbed bedrock.

B. No materials shall be placed in any portion of the dam foundation until the foundation for each section has been dewatered, stripped, excavated to grade, and suitably prepared, and has been inspected and approved by the Engineer or Engineer’s qualified designee.

C. All cavities, depressions, and irregularities, either existing or resulting from removal of loose or weathered rock fragments found within the area to be covered by concrete and which extend below or beyond the established lines of excavation for the dam shall be filled with concrete fill as specified for the overlying dam structure and/or treated by slush grouting and dental concrete.

D. All joints, shear zones, cracks, openings, and irregularities shall be adequately cleaned out and treated with slush grouting or dental concrete, or in other areas directed by the Engineer.

E. The suitability of each section of the foundation for placing dam materials thereon will be determined by the Engineer.

F. No concrete materials shall be placed when the subgrade is frozen.

G. No concrete materials shall be placed in standing water.

H. The bottom and side slopes of excavation upon or against which concrete is to be placed shall be excavated to the required dimensions as shown on Drawings. No material will be permitted to extend within the neatlines of the structure.

I. If, at any point in rock or foundation material preparation, the natural foundation material is disturbed or loosened, it shall be removed and replaced with concrete fill.

J. Immediately prior to placing the first layer of concrete, all bedrock surfaces upon or against which the concrete is to be cast against shall be cleaned of all loose and objectional materials in an approved manner by handwork, barring, picking, brooming, air jetting, or other effective means. Such surfaces shall be properly moistened and sufficiently cleaned so that the concrete will bond intimately to the surfaces. Standing water shall be removed from depressions prior to placement of concrete. All open joints, cracks, and fissures in the foundation shall be cleaned of all loose material and loose bedrock material to
a depth equal to at least three times their width, or to a depth where the opening is 0.5-inch-wide or less, whichever depth is greater, but not to exceed 2 feet and backfilled as directed with either slush grout or dental concrete.

K. Vertical bedrock surfaces shall not be more than 4 feet in height, and benches of sufficient width shall be provided as necessary so that the average slope of any bedrock excavation is not steeper than one horizontal to two vertical. Resloping of bedrock surfaces shall be accomplished by the method that results in the least damage to the formation left in place.

L. Exposed finished excavated surfaces shall be kept moist at all times to prevent evaporation of the natural moisture in the material and shall be protected from freezing. Exposure of excavated bedrock foundation surface upon which concrete is to be placed shall be limited to 48 hours, which time shall commence at the completion of each portion of the excavation, and which will include the time required for final cleanup and surface treatment. Contractor shall mobilize sufficient equipment, materials, and manpower prior to the start of final excavation in order to limit the exposure time so specified. At Contractor’s option, he/she may complete the excavation to final grade without leaving temporary cover of unexcavated material provided that time of exposure of the final excavated surface is limited as described herein and a depth of 3 feet of temporary loose earthfill is placed over the surface to protect it from air slaking and freezing. The temporary loose earthfill shall be completed removed and the bedrock subgrade cleaned and treated prior to placement of concrete so long as the time of exposure between removal of the loose earthfill and placement of concrete is less than 36 hours.

M. Surfaces to receive concrete upon or against shall be cleaned of all loose material, dirt, dust, mud, standing water, and other foreign matter.

N. Slush Grouting Foundations:

1. Where directed by the Engineer, apply slush grouting to cracks, crevices, or broken or fractured portions of the prepared bedrock surface under the areas to receive concrete and other areas as directed. Use of slush grouting shall only be at the direction of the Engineer.

2. Materials: the slush grout shall be composed of neat cement grout or cement, sand, and water. The ratios of the materials may vary as directed by the Engineer, but the ratio of sand to cement will not exceed 2 parts sand to 1 part cement. Adequate water shall be mixed thoroughly into the cement or cement and sand mixes to produce a workable mixture for proper placement as approved by the Engineer. The grout mixture shall be prepared with a mechanical mixer and shall be used within 30 minutes after mixing.
3. Placement: Slush grout shall be used to fill foundation surface cracks, crevices, and fractures at locations directed by the Engineer. Slush grout shall not be used to cover exposed areas of the bedrock subgrade. All joints, cracks, crevices, and fractures to be treated shall be thoroughly cleaned of all loose materials as noted above and shall be wetted immediately prior to placement of the slush grout material. Placement of slush grouting shall be by brooming into all cracks, crevices, and fractures with a stiff-bristled broom or other approved method, but grout layers shall not be left on the foundation beyond the edge of the crack, crevice, or fracture. Finished surfaces of slush grouting shall be left in a roughened, broomed finish to provide a satisfactory bonding surface for the concrete.

4. The quantity of slush grout is uncertain, and the contractor shall be entitled to no additional allowance above the bid price in the schedule by reason of increased or decreased quantities awarded.

O. Dental Concrete:

1. Where directed by the Engineer, place dental concrete in exposed areas of broken, fractured, or sheared portions of the dam foundation surface; gate structures; end walls or training walls; and at other locations as directed by the Engineer. Dental concrete shall be used in areas too large to be satisfactorily treated by slush grouting and volumes too small to be satisfactorily filled by concrete placement as determined by the Engineer.

2. Materials: Dental concrete shall be lean concrete conforming to Concrete Fill as specified in Section 03 30 00, Cast-in-Place Concrete.

3. Placing Dental Concrete: Where it is not practicable to excavate local overhanging rock faces or rock faces steeper than 0.5 horizontal to 1 vertical without detrimental disturbance or excessive material excavation, the rock faces shall be solidly faced with dental concrete to provide abutment contact slopes not steeper than 0.5 horizontal to 1 vertical.

4. Where soft zones or areas exist in the surface of the foundation, they shall be excavated to the extent directed and backfilled with dental concrete. Soft zones are defined as those which can be hand-excavated with a shovel or consist of loose, detached, or hollow-sounding layers of sandstone.

5. Designated voids shall be properly excavated and cleaned of all loose materials as approved by the Engineer. Open joints, shear zones, and fractured areas shall be cleaned. Dental concrete shall be placed as required to form a tight, unfractured foundation surface against which the dam or concrete structure may be placed.
6. Finished surfaces of dental concrete shall be left in a roughened, broomed finish to provide a satisfactory bonding surface for the concrete materials.

7. The quantity of dental concrete is uncertain, and the contractor shall be entitled to no additional allowance above the Bid price in the schedule by reason of increased or decreased quantities awarded.

3.07 GROUTED CORE ROCK SUBGRADE PREPARATION

A. No materials shall be placed in any portion of the grouted core rock foundation until the foundation for each section has been dewatered, stripped, excavated to grade, and suitably prepared, and has been approved by the Engineer or Engineer’s qualified designee.

B. All cavities, depressions, and irregularities, either existing or resulting from removal of loose or weathered rock fragments found within the area to be covered by concrete and which extend below or beyond the established lines of excavation for the dam shall be filled with concrete fill.

C. The suitability of each section of the foundation for placing grouted core rock materials thereon will be determined by the Engineer. No concrete materials shall be placed when the subgrade is frozen.

D. The bottom and side slopes of excavation upon or against which grouted core rock is to be placed shall be excavated intact sandstone bedrock as approved by the Engineer.

E. If, at any point in rock or foundation materials, the natural foundation material is disturbed or loosened, it shall be removed and replaced with concrete fill.

F. Immediately prior to placing the first layer of concrete, all bedrock surfaces upon or against which the concrete is to be cast against shall be cleaned of all loose and objectional materials in an approved manner by handwork, barring, picking, brooming, air jetting, or other effective means. Such surfaces shall be properly moistened and sufficiently cleaned so that the grouted riprap will bond intimately to the surfaces. Standing water shall be removed from depressions prior to placement of grouted core rock.

G. Where soft zones or areas exist in the surface of the foundation, they shall be excavated to the extent directed by the Engineer and backfilled with dental concrete. Soft zones are defined as those which can be hand-excavated with a shovel or consist of loose, detached, or hollow-sounding layers of sandstone.
ZINK DAM IMPROVEMENTS

H. Designated voids shall be properly excavated and cleaned of all loose materials as approved by the Engineer. Open joints, shear zones, and fractured areas shall be cleaned. Dental concrete shall be placed as required to form a tight, unfractured foundation surface against which the dam or concrete structure may be placed.

I. Finished surfaces of dental concrete shall be left in a roughened, broomed finish to provide a satisfactory bonding surface for the concrete materials.

J. The quantity of dental concrete is uncertain, and the Contractor shall be entitled to no additional allowance above the Bid price in the schedule by reason of increased or decreased quantities awarded.

3.08 RIPRAP SUBGRADE PREPARATION

A. Where fill materials are to be placed upon existing riprap, the existing riprap surface shall be prepared.

B. Remove and dispose of unsuitable materials such as debris, trash, interfering or objectionable material, river sediment, vegetative matter, wood, standing water, damaged riprap, and similar materials.

C. Immediately report to Engineer the presence of existing riprap conditions which, by inspection, do not conform to the specified requirements for riprap material or placement stated in Section 31 37 00, Riprap, or do not match the lines and grades shown on Record Drawings for existing riprap revetments. Engineer will direct removal and replacement of riprap. Riprap material designated for removal shall be removed and disposed of offsite and replaced with new riprap conforming to Section 31 37 00, Riprap, and with the design intent of the original riprap revetment, as directed in the field by the Engineer.

D. Modify riprap surface to stable configuration by manipulating individual riprap pieces into a stable configuration and uniform surface.

E. Obtain Engineer’s approval of final subgrade prior to placing fill materials upon riprap subgrade.

END OF SECTION
PART 1  GENERAL

1.01  SUBMITTALS

A.  Informational Submittals:

1.  Excavation Plan, Detailing:
   a.  Methods and sequencing of excavation.
   b.  Proposed locations of stockpiled excavated material.
   c.  Proposed onsite and offsite spoil disposal sites.
   d.  Numbers, types, and sizes of equipment proposed to perform excavations.
   e.  Anticipated difficulties and proposed resolutions.

2.  East Bank Reinforced Soil Slope Excavation Plan:
   a.  Submit a separate plan for every excavation on the East Bank which is anticipated to disturb the existing geotextile and geogrid reinforcing elements.
   b.  Plan shall include a narrative of excavation approach, and include plan, section, and elevation drawings which clearly indicate the proposed limits of excavation and the reinforcement elements which will be disturbed.
   c.  Include proposed methods for surveying and documenting existing conditions encountered during excavation. Such documentation shall be of sufficient accuracy and detail to compare existing geometry to the Design Drawings prepared for the existing reinforced soil slope elements.
   d.  Documentation of excavation conditions shall be used by the Contractor in subsequent submittals which describe the proposed methods for restoring reinforcement and riprap armoring.
   e.  Describe measures taken to minimize the extents of disturbance.
   f.  Include discussion of anticipated difficulties and proposed resolutions.
   g.  Submit plan to Engineer minimum 1 week before initiation of excavation.

1.02  QUALITY ASSURANCE

A.  Provide adequate survey control to avoid unauthorized overexcavation.
1.03 WEATHER LIMITATIONS

A. Material excavated when frozen or when air temperature is less than 32 degrees F shall not be used as fill or backfill until material completely thaws.

B. Excavation to finish grade shall protect subgrade from freezing, desiccation, and disturbance as described in Section 31 23 13, Subgrade Preparation.

C. Material excavated during inclement weather shall not be used as fill or backfill until after material drains and dries sufficiently for proper compaction.

1.04 SEQUENCING AND SCHEDULING

A. Demolition: Complete applicable Work specified in Section 02 41 00, Demolition, prior to excavating.

B. Clearing, Grubbing, and Stripping: Complete applicable Work specified in Section 31 10 00, Site Clearing, prior to excavating.

C. Subgrade Preparation: Conform to applicable requirements of Section 31 23 13, Subgrade Preparation.

D. Dewatering: Conform to applicable requirements of Section 31 23 19.01, Dewatering, prior to initiating excavation.

E. Excavation Support: Install and maintain, as specified in Section 31 41 00, Shoring, as necessary to support sides of excavations and prevent detrimental settlement and lateral movement of existing facilities, adjacent property, and completed Work.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Excavate to lines, grades, and dimensions shown and as necessary to accomplish Work. Excavate to within tolerance of plus or minus 0.1 foot, except where dimensions or grades are shown or specified as maximum or minimum. Allow for forms, working space, granular base, bedding, cushion layers, topsoil, and similar items, wherever applicable. Trim to neat lines where concrete is to be deposited against earth.

B. Do not overexcavate without written authorization of Engineer.
C. Remove or protect obstructions as shown and as specified in Section 01 50 00, Temporary Facilities and Controls, Article Protection of Work and Property.

D. Blasting is not allowed. Excavate all soil and bedrock using mechanical and/or non-explosive methods to lines and grades shown. Excavation methods shall protect existing bedrock subgrades and surfaces to remain from disturbance.

E. Bedrock excavation means and methods shall not impart disturbance or damage to bedrock materials beyond the limits of excavation. Protect all existing and surrounding bedrock surfaces to remain from disturbance or damage. Excessive disturbance to bedrock not designated for removal which is imparted by Contractor’s means and methods shall be repaired by the Contractor at the Engineer’s direction and at the Contractor’s sole expense.

3.02 EXCAVATION INTO EXISTING EAST BANK REINFORCED SOIL SLOPE

A. The East Bank of the Arkansas River is supported by a riprap-armored geogrid-reinforced soil slope constructed as part of the Gathering Place Park construction.

B. Protect existing East Bank reinforced soil slope at all times. Do not disturb existing geotextile or geogrid reinforcement layers without prior approval of East Bank Reinforced Soil Slope Excavation Plan for planned excavations which extend below the surface of the reinforced soil slope.

C. Immediately report any and all unintended disturbances to the Engineer. Such unauthorized disturbances shall be repaired or replaced to the satisfaction of the Engineer at no cost to the Owner.

D. Document excavations which disturb riprap or slope reinforcement elements with sufficient accuracy to support comparison of existing conditions to original Gathering Place Design Drawings and to support design of subsequent reconstruction of slopes. Submit documentation to Engineer with 72 hours of completion of authorized excavation.

E. Reconstruction of existing slopes will generally include and repair and/or replacement of existing geogrid, geotextile, compacted fill materials, riprap, riprap bedding, underdrains, cushion sands, and other materials used in existing slope construction.

3.03 UNCLASSIFIED EXCAVATION

A. Excavation is unclassified. Complete all excavation regardless of the type, nature, or condition of the materials encountered.
B. Ground surface in the river channel varies from that shown due to natural variation in sediment river flows, seasonal variations, and dam operations. Field verify existing grades and bedrock surface conditions prior to construction.

C. Make own assessment of bedrock excavation requirements.

3.04 TRENCH WIDTH

A. Minimum Width of Trenches:
   1. Single Pipes, Conduits, Direct-Buried Cables, and Duct Banks:
      a. Less than 4-inch Outside Diameter or Width: 18 inches.
      b. Greater than 4-inch Outside Diameter or Width: 18 inches greater than outside diameter or width of pipe, conduit, direct-buried cable, or duct bank.
   2. Multiple Pipes, Conduits, Cables, or Duct Banks in Single Trench: 18 inches greater than aggregate width of pipes, conduits, cables, duct banks, plus space between.
   3. Increase trench widths by thicknesses of sheeting.

B. Maximum Trench Width: Unlimited, unless otherwise shown or specified, or unless excess width will cause damage to existing facilities, adjacent property, or completed Work.

3.05 EMBANKMENT AND CUT SLOPES

A. Shape, trim, and finish cut slopes to conform with lines, grades, and cross-sections shown, with proper allowance for topsoil or slope protection, where shown.

B. Remove stones and rock that exceed 3-inch diameter and that are loose and may roll down slope. Remove exposed roots from cut slopes.

C. Round tops of cut slopes in soil to not less than a 6-foot radius, provided such rounding does not extend offsite or outside easements and rights-of-way, or adversely impacts existing facilities, adjacent property, or completed Work.

D. Bedrock excavation shall be no higher than 4 feet in vertical cut. Overall bedrock excavation shall be stepped to have an overall average slope of 0.5 horizontal to 1 vertical. Any undercutting of bedrock shall be trimmed to sound undisturbed bedrock with a positive slope. Refer to additional requirements in Section 31 23 13, Subgrade Preparation.
3.06 STOCKPILING EXCAVATED MATERIAL

A. Stockpile excavated material that is suitable for use as fill or backfill until material is needed.

B. Excavated bedrock is unsuitable for reuse as riprap, grouted core rock, or other aggregate. Dispose of excavated bedrock offsite.

C. Post signs indicating proposed use of material stockpiled. Post signs that are readable from all directions of approach to each stockpile. Signs should be clearly worded and readable by equipment operators from their normal seated position.

D. Confine stockpiles to within easements, rights-of-way, and approved work areas. Do not obstruct roads or streets.

E. Do not stockpile excavated material adjacent to trenches and other excavations, unless excavation side slopes and excavation support systems are designed, constructed, and maintained for stockpile loads.

F. Do not stockpile excavated materials near or over existing facilities, adjacent property, or completed Work, if weight of stockpiled material could induce excessive settlement.

3.07 DISPOSAL OF SPOIL

A. Dispose of excavated materials, which are unsuitable or exceed quantity needed for fill or backfill, offsite.

B. Dispose of debris resulting from removal of underground facilities as specified in Section 02 41 00, Demolition, for demolition debris.

C. Dispose of debris resulting from removal of organic matter, trash, refuse, and junk as specified in Section 31 10 00, Site Clearing, for clearing and grubbing debris.

END OF SECTION
PART 1 GENERAL

1.01 SUBMITTALS

A. Informational Submittals:

2. Well permits.
3. Discharge permits.
4. Water Level Elevations Observed in Observation Wells: Submit same day measured.
5. Settlement Benchmark Elevations: Submit weekly record.

1.02 WATER CONTROL PLAN

A. As a minimum, include:

1. Descriptions of proposed groundwater and surface water control facilities including, but not limited to, equipment; methods; standby equipment and power supply, pollution control facilities, discharge locations to be utilized, and provisions for immediate temporary water supply as required by this section.
2. Drawings showing locations, dimensions, and relationships of elements of each system.
3. Design calculations demonstrating adequacy of proposed dewatering systems and components.

B. If system is modified during installation or operation revise or amend and resubmit Water Control Plan.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. For construction of project components within the Arkansas River corridor which may be damaged by flooding, continuously control water during course of construction, including weekends and holidays and during periods of work stoppages, and provide adequate backup systems to maintain control of water. Coordinate project dewatering with cofferdamming and diversion activities.
3.02 SURFACE WATER CONTROL

A. See Section 01 58 00, Diversion and Care of Water.

B. Remove surface runoff controls when no longer needed.

3.03 DEWATERING SYSTEMS

A. Provide, operate, and maintain dewatering systems of sufficient size and capacity to permit excavation and subsequent construction in dry and to lower and maintain groundwater level a minimum of 2 feet below the lowest point of excavations in soil and at or below the lowest point of excavations in bedrock. Continuously maintain excavations free of water, regardless of source, and until backfilled to final grade.

B. Design and Operate Dewatering Systems:
   1. To prevent loss of ground as water is removed.
   2. To avoid inducing settlement or damage to existing facilities, completed Work, or adjacent property.
   3. To relieve artesian pressures and resultant uplift of excavation bottom.

C. Provide sufficient redundancy in each system to keep excavation free of water in event of component failure.

D. Make own assessment of means and methods required to meet the requirements of this specification, including, but not limited to, the use of secondary groundwater or surface water control systems within cofferdammimg systems which control water within cofferdams around areas to be dewatered.

3.04 DISPOSAL OF WATER

A. Obtain discharge permit for water disposal from authorities having jurisdiction.

B. Treat water collected by dewatering operations, as required by regulatory agencies, prior to discharge.
C. Discharge water as required by discharge permit and in manner that will not cause erosion or flooding, or otherwise damage existing facilities, completed Work, or adjacent property.

D. Remove solids from treatment facilities and perform other maintenance of treatment facilities as necessary to maintain their efficiency. Dispose of solids offsite.

3.05 PROTECTION OF PROPERTY

A. Make assessment of potential for dewatering induced settlement. Provide and operate devices or systems, including but not limited to reinjection wells, infiltration trenches and cutoff walls, necessary to prevent damage to existing facilities, completed Work, and adjacent property.

B. Securely support existing facilities, completed Work, and adjacent property vulnerable to settlement due to dewatering operations. Support shall include, but not be limited to, bracing, underpinning, or compaction grouting.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   d. D698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN·m/m³)).
   e. D1556, Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method.
   f. D1557, Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³ (2,700 kN·m/m³)).
   g. D4253, Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
   i. D6938, Standard Test Methods for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).

1.02 DEFINITIONS

A. Relative Compaction:

1. Ratio, in percent, of as-compacted field dry density to laboratory maximum dry density as determined in accordance with ASTM D698.
2. Apply corrections for oversize material to either as-compacted field dry density or maximum dry density, as determined by Engineer.
B. Optimum Moisture Content:
   1. Determined in accordance with ASTM Standard specified to determine
      maximum dry density for relative compaction.
   2. Determine field moisture content on basis of fraction passing 3/4-inch
      sieve.

C. Relative Density: Calculated in accordance with ASTM D4254 based on
   maximum index density determined in accordance with ASTM D4253 and
   minimum index density determined in accordance with ASTM D4254.

D. Prepared Ground Surface: Ground surface after completion of required
   demolition, clearing and grubbing, scalping of sod, stripping of topsoil,
   excavation to grade, and subgrade preparation.

E. Completed Course: A course or layer that is ready for next layer or next phase
   of Work.

F. Lift: Loose (uncompacted) layer of material.

G. Geosynthetics: Geotextiles, geogrids, or geomembranes.

H. Well-Graded:
   1. A mixture of particle sizes with no specific concentration or lack thereof
      of one or more sizes.
   2. Does not define numerical value that must be placed on coefficient of
      uniformity, coefficient of curvature, or other specific grain size
      distribution parameters.
   3. Used to define material type that, when compacted, produces a strong
      and relatively incompressible soil mass free from detrimental voids.

I. Influence Area:
   1. Area within planes sloped downward and outward at 60-degree angle
      from horizontal measured from:
      a. 1 foot outside outermost edge at base of foundations or slabs.
      b. 1 foot outside outermost edge at surface of roadways or shoulder.
      c. 0.5 foot outside exterior at spring line of pipes or culverts.

J. Borrow Material: Material from required excavations or from designated
   borrow areas on or near Site.

K. Selected Backfill Material: Materials available onsite that Engineer
   determines to be suitable for specific use.
L. Imported Material: Materials obtained from sources offsite, suitable for specified use.

M. Riprap Void Fill: Rounded pea gravel aggregate used to fill voids in existing riprap prior to placing additional fill.

N. Structural Fill: Fill materials as required under structures, pavements, and other facilities.

O. Embankment Material: Fill materials required to raise existing grade in areas other than under structures.

1.03 SUBMITTALS

A. Action Submittals:
   1. Samples: Imported material taken at source.

B. Informational Submittals:
   1. Manufacturer’s data sheets for compaction equipment.
   2. Certified test results from independent testing agency.

1.04 QUALITY ASSURANCE

A. Notify Engineer when:
   1. Structure is ready for backfilling, and whenever backfilling operations are resumed after a period of inactivity.
   2. Soft or loose subgrade materials are encountered wherever embankment or site fill is to be placed.
   3. Fill material appears to be deviating from Specifications.

1.05 SEQUENCING AND SCHEDULING

A. Complete applicable Work specified in Section 02 41 00, Demolition; Section 31 10 00, Site Clearing; Section 31 23 16, Excavation; and Section 31 23 13, Subgrade Preparation, prior to placing fill or backfill.

B. Backfill against concrete structures only after concrete has attained 95 percent of design compressive strength, specified in Section 03 30 00, Cast-in-Place Concrete. Obtain Engineer’s acceptance of concrete work and attained strength prior to placing backfill.
C. Do not place any fill or backfill materials until after subgrade has been prepared as specified in Section 31 23 13, Subgrade Preparation.

PART 2 PRODUCTS

2.01 SOURCE QUALITY CONTROL

A. Gradation Tests:
   1. As necessary to locate acceptable sources of imported material.
   2. During production of imported material, test as follows:
      a. Granular Fill: Every 1,000 tons.
      b. Sand: Every 500 tons.
      c. Granular Drain Material: Every 500 tons.
      d. Base Course Rock: Every 500 tons.
      e. Foundation Stabilization Rock: Every 500 tons.
      f. Riprap Filter Material: Every 500 tons.
      g. 4-inch Rockfill: Every 500 tons.
      h. Riprap Void Fill: Every 500 tons.

B. Samples:
   1. Collected in accordance with ASTM D75:
      a. During production of imported material, provide Samples as follows:
         1) Granular Fill: Every 1,500 tons.
         2) Sand: Every 500 tons.
         3) Granular Drain Material: Every 500 tons.
         4) Base Course Rock: Every 500 tons.
         5) Foundation Stabilization Rock: Every 500 tons.
         6) Riprap Filter Material: Every 500 tons.
         7) 4-inch Rockfill: Every 500 tons.
         8) Riprap Void Fill: Every 500 tons.
      b. Clearly mark to show source of material and intended use.

2.02 EARTHFILL

A. Excavated material from required excavations and designated borrow sites, free from rocks larger than 3 inches, from roots and other organic matter, ashes, cinders, trash, debris, and other deleterious materials and containing less than 20 percent fines (passing the No. 200 sieve) as determined by ASTM C136.

B. Material containing more than 10 percent gravel, bedrock fragments, stones, or shale particles is unacceptable.
C. Provide imported material of equivalent quality, if required to accomplish Work.

2.03 RIPRAP FILTER MATERIAL

A. Gradation:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 inches</td>
<td>100</td>
</tr>
<tr>
<td>6 inches</td>

<td>5 to 15</td>
</tr>
</tbody>
</table>

B. Bulk specific gravity greater than 2.25 and absorption less than 6.0 percent as measured by ASTM D6473.

C. Loss of soundness less than or equal to 15 percent after 20 cycles when tested in accordance with U.S. Army Corps of Engineers test method CRD-C144.

D. Width and thickness of individual pieces shall be at least one-third the length.

E. No compaction required. Work material manually in thin lifts to create a dense configuration with smaller particles distributed through the mass and occupying the void space between larger particles.

F. Where placed upon or against larger size riprap, work material into voids in large riprap to choke off material against movement into larger riprap.

2.04 4-INCH ROCKFILL

A. Conforming to Single Course Filter Blanket Material as described in Section 713:4 of the Standard Specifications.

B. Used for fill placed on the East Bank.

C. Placed in maximum 8-inch loose lifts and compacted to minimum 95 percent relative compaction in accordance with ASTM D698.

2.05 RIPRAP VOID FILL

A. Clean “Pea Gravel” aggregate, free from dirt, organics, silt, clay, or other deleterious materials.
B. Used to fill voids within existing revetment riprap to prevent internal erosion of coarse fill materials into riprap voids.

C. Compaction or testing of riprap void fill is not required.

D. Particle Shape: Rounded to subrounded as defined by ASTM D2488 with no sharp edges; uncrushed.

E. Gradation Requirements:

</table>

2.06 GRANULAR FILL

A. 1-inch minus crushed gravel or crushed rock.

B. Free from dirt, clay balls, and organic material.

C. Well-graded from coarse to fine and containing sufficient fines to bind material when compacted, but with maximum 8 percent by weight passing No. 200 sieve.

2.07 GRAVEL FOR ACCESS ROADS AND STAGING

A. 1.5-inch minus crushed gravel, stone, granite or concrete in accordance with a Bases and Miscellaneous Aggregates as defined by Section 703.01, Type D of the 2009 edition of the Oklahoma Standard Specifications.

B. Free from dirt, clay balls, and organic material.

2.08 GEOTEXTILE CUSHION SAND

A. Conforming to Filter Blanket Material Lower Course as specified in Section 7.02 of the 2009 edition of the Oklahoma Standard Specifications.

B. Place between geotextile and adjacent coarse angular materials to protect geotextile from punctures and tearing. Place minimum 4 inches thick.
2.09 SAND
A. Free from clay, organic matter, or other deleterious material.
B. Gradation as determined in accordance with ASTM C117 and ASTM C136:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/4-inch</td>
<td>100</td>

<td>0 - 8</td>
</tr>
</tbody>
</table>

2.10 GRANULAR DRAIN MATERIAL
A. As specified in Section 31 23 23.15, Trench Backfill.

2.11 WATER FOR MOISTURE CONDITIONING
A. Free of hazardous or toxic contaminants, or contaminants deleterious to proper compaction.

2.12 FOUNDATION STABILIZATION ROCK
A. Crushed durable limestone rock or pit run rock.
B. Uniformly graded from coarse to fine.
C. Free from excessive dirt and other organic material.
D. Maximum 2-1/2-inch particle size.
E. Use of shale or native sandstone from the Site is not permitted.

2.13 SOIL COVER OVER GEOTEXTILES
A. Particle Size: Maximum 0.75-inch.
B. Free of sharp angular pieces that may damage geotextile.

2.14 CONCRETE FILL
A. As specified in Section 31 23 23.15, Trench Backfill.
PART 3  EXECUTION

3.01  GENERAL

A. Keep placement surfaces free of water, debris, and foreign material during placement and compaction of fill and backfill materials.

B. Place and spread fill and backfill materials in horizontal lifts of uniform thickness, in a manner that avoids segregation, and compact each lift to specified densities prior to placing succeeding lifts. Slope lifts only where necessary to conform to final grades or as necessary to keep placement surfaces drained of water.

C. During filling and backfilling, keep level of fill and backfill around each structure and buried tank even.

D. Do not place fill or backfill, if fill or backfill material is frozen, or if surface upon which fill or backfill is to be placed is frozen.

E. If pipe, conduit, duct bank, or cable is to be laid within fill or backfill:
   1. Fill or backfill to an elevation 2 feet above top of item to be laid.
   2. Excavate trench for installation of item.
   3. Install bedding, if applicable, as specified in Section 31 23 23.15, Trench Backfill.
   4. Install item.
   5. Backfill envelope zone and remaining trench, as specified in Section 31 23 23.15, Trench Backfill, before resuming filling or backfilling specified in this section.

F. Tolerances:
   1. Final Lines and Grades: Within a tolerance of 0.1 foot unless dimensions or grades are shown or specified otherwise.
   2. Grade to establish and maintain slopes and drainage as shown. Reverse slopes are not permitted.

G. Settlement: Correct and repair any subsequent damage to structures, pavements, curbs, slabs, piping, and other facilities, caused by settlement of fill or backfill material.

3.02  BACKFILL UNDER AND AROUND STRUCTURES

A. Under Concrete Structures Bearing on Bedrock: Concrete fill as specified in Section 31 23 23.15, Trench Backfill. Do not place granular materials between structures and bedrock unless directed by the Engineer.
B. Under Grouted Core Rock: Concrete fill as specified in Section 31 23 23.15, Trench Backfill. Do not place granular materials between grouted core rock and bedrock unless directed by the Engineer.

C. Under Facilities Bearing on Soil: Within influence area beneath structures, slabs, pavements, curbs, piping, conduits, duct banks, and other facilities, backfill with granular fill, unless otherwise shown. Place granular fill in lifts of 6-inch maximum thickness and compact each lift to minimum of 98 percent relative compaction as determined in accordance with ASTM D698.

D. Subsurface Drainage: Backfill with granular drain material, where shown. Place granular drain material in lifts of 6-inch maximum thickness and compact. Incorporate and protect geotextile fabric where shown.

E. Other Areas: Backfill with granular fill to lines and grades shown, with proper allowance for topsoil thickness where shown. Place in lifts of 6-inch maximum thickness and compact each lift to minimum 98 percent relative compaction as determined in accordance with ASTM D698.

3.03 FILL

A. Outside Influence Areas beneath Structures, Tanks, Pavements, Curbs, Slabs, Piping, and Other Facilities:

1. Unless otherwise shown, place earthfill as follows:
   a. Allow for 6-inch thickness of topsoil where required.
   b. Maximum 8-inch thick lifts.
   c. Place and compact fill across full width of embankment.
   d. Compact to minimum 95 percent relative compaction as determined in accordance with ASTM D698 and based upon average of most recent four tests on like material. If any two of the four most recent tests falls below 95 percent, additional compactive effort will be required.
   e. Dress completed embankment with allowance for topsoil, crest surfacing, and slope protection, where applicable.

3.04 4-INCH ROCKFILL

A. Place 4-inch Rockfill in horizontal lifts of 8-inch maximum thickness and compact to 95 percent relative compaction in accordance with ASTM D698.

B. Where geotextile is placed above or below, include allowances for geotextile cushion sand.
3.05  SITE TESTING

A.  Gradation:

1.  One sample from each 1,500 tons of finished product or more often as determined by Engineer, if variation in gradation is occurring, or if material appears to depart from Specifications.
2.  If test results indicate material does not meet Specification requirements, terminate material placement until corrective measures are taken.
3.  Remove material placed in Work that does not meet Specification requirements.

B.  In-Place Density Tests:

1.  In accordance with ASTM D6938. During placement of materials, test as follows:
   a.  Granular Fill: At least one test per day during placement and one test every 10 cubic yards.
   b.  Sand: Every 5 cubic yards.
   c.  Base Course Rock: One test for every 50 cubic yards of in place material.
   d.  Riprap Void Fill: Not required.
   e.  4-inch Rockfill: One test for every 50 cubic yards of in place material.

3.06  REPLACING OVEREXCAVATED MATERIAL

A.  Replace excavation carried belowgrade lines shown or established by Engineer as follows:

1.  Beneath Footings: Concrete fill as specified in Section 31 23 23.15, Trench Backfill.
2.  Beneath Grouted Core Rock: Concrete fill as specified in Section 31 23 23.15, Trench Backfill.
3.  Beneath Fill or Backfill: Same material as specified for overlying fill or backfill.
5.  Trenches:
   a.  Trenches in Bedrock: Concrete fill as specified in Section 31 23 23.15, Trench Backfill.
   b.  Unauthorized Overexcavation: Either trench stabilization material or granular pipe base material, as specified in Section 31 23 23.15, Trench Backfill.
   c.  Authorized Overexcavation: Trench stabilization material, as specified in Section 31 23 23.15, Trench Backfill.
6. Permanent Cut Slopes (Where Overlying Area is Not to Receive Fill or Backfill):
   a. Flat to Moderate Steep Slopes (3:1, Horizontal Run: Vertical Rise or Flatter): Earthfill.
   b. Steep Slopes (Steeper than 3:1):
      1) Correct overexcavation by transitioning between overcut areas and designed slope adjoining areas, provided such cutting does not extend offsite or outside easements and right-of-ways, or adversely impacts existing facilities, adjacent property, or completed Work.
      2) Backfilling overexcavated areas is prohibited, unless in Engineer’s opinion, backfill will remain stable, and overexcavated material is replaced as compacted earthfill.

3.07 PLACING FILL OVER GEOSYNTHETICS

A. General:
   1. Place fill over geosynthetics with sufficient care so as not to damage them.
   2. Place fill only by back dumping and spreading only.
   3. Dump fill only on previously placed fill.
   4. While operating equipment, avoid sharp turns, sudden starts or stops that could damage geosynthetics.
   5. Where fill materials over geosynthetics include coarse angular materials which could damage geotextile, include allowances for geotextile cushion sand.

B. Hauling: Operate hauling equipment on minimum of 3 feet of covering.

C. Spreading:
   1. Spreading equipment shall be track mounted low ground pressure, D-6 or lighter.
   2. Operate spreading equipment on minimum of 12 inches of fill over geosynthetics.
   3. Spread fill in same direction as unseamed overlaps to avoid separation of seams and joints.
   4. Never push fill downslope. Spread fill over sideslopes by pushing up from slope bottom. If access to bottom of slope is unavailable, progressively place fill, beginning at toe of slope and working upslope, with backhoe or dragline operated from top of slope. Limit distance material falls onto the geosynthetics to maximum of 2 feet.
   5. Flatten wrinkles of geosynthetics in direction of spreading. Correct wrinkles in geotextiles as specified in Section 31 32 19.16, Geotextile.
7. Avoid overstressing geosynthetics and seams.

D. Compaction: Compact fill only after uniformly spread to full thickness shown.

E. Geosynthetic Damage:
   1. Mark punctures, tears, or other damage to geosynthetics, so repairs may be made.
   2. Clear overlying fill as necessary to repair damage.
   3. Repairs to geosynthetics shall be made by respective installers as specified in respective specification section for each geosynthetic.

3.08 RIPRAP VOID FILL

A. Place Riprap Void Fill on prepared riprap surface.

B. Where placed on slopes, place riprap void fill from bottom to top, completely filling voids in riprap.

C. Compaction of riprap void fill is not required, however, void fill shall be worked into riprap voids by rodding, jetting, vibrating, manually manipulating riprap pieces with prybars, and/or other methods which completely fill voids within the riprap.

D. Bring riprap void fill to within approximately 4 inches of the surface of riprap designated to receive riprap void fill. Do not place Riprap void fill above the surface of the riprap.

E. Maintain riprap void fill free of contamination with silt, sand, organics, debris, or other deleterious materials.

F. Protect riprap void fill from scour and erosion at all times until overlying geotextile and fill materials are placed.

G. Replace areas of riprap void fill which are contaminated or eroded.

3.09 ACCESS ROAD SURFACING

A. Place and compact as specified in Standard Specifications.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

2. ASTM International (ASTM):
   f. C618, Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete.
   h. D698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³)).
   j. D1557, Standard Test Methods for Laboratory Compaction Characteristics of Soil using Modified Effort (56,000 ft-lbf/ft³ (2,700 kN-m/m³)).
   k. D2487, Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System).
   l. D4253, Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
   m. D4254, Standard Test Methods for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density.
1.02 DEFINITIONS

A. Base Rock: Granular material upon which manhole bases and other structures are placed.

B. Bedding Material: Granular material upon which pipes, conduits, cables, or duct banks are placed.

C. Imported Material: Material obtained by Contractor from source(s) offsite.

D. Lift: Loose (uncompacted) layer of material.

E. Pipe Zone: Backfill zone that includes full trench width and extends from prepared trench bottom to an upper limit above top outside surface of pipe, conduit, cable or duct bank.

F. Prepared Trench Bottom: Graded trench bottom after excavation and installation of stabilization material, if required, but before installation of bedding material.

G. Relative Compaction: The ratio, in percent, of the as-compacted field dry density to the laboratory maximum dry density as determined by ASTM D698. Corrections for oversize material may be applied to either as-compacted field dry density or maximum dry density, as determined by Engineer.

H. Relative Density: As defined by ASTM D4253 and ASTM D4254.

I. Selected Backfill Material: Material available onsite that Engineer determines to be suitable for a specific use.

J. Well-Graded: A mixture of particle sizes that has no specific concentration or lack thereof of one or more sizes producing a material type that, when compacted, produces a strong and relatively incompressible soil mass free from detrimental voids. Satisfying both of the following requirements, as defined in ASTM D2487:

1. Coefficient of Curvature: Greater than or equal to 1 and less than or equal to 3.
2. Coefficient of Uniformity: Greater than or equal to 4 for materials classified as gravel, and greater than or equal to 6 for materials classified as sand.
1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings: Manufacturer’s descriptive literature for marking tapes.
2. Samples:
   a. Trench stabilization material.
   b. Bedding and pipe zone material.
   c. Granular drain material.
   d. Granular backfill.
   e. Earthfill.
   f. Geotextile.

B. Informational Submittals:

1. Catalog and manufacturer’s data sheets for compaction equipment.
2. Certified Gradation Analysis: Submit not less than 30 days prior to delivery for imported materials or anticipated use for excavated materials, except for trench stabilization material that will be submitted prior to material delivery to Site.
3. Controlled Low Strength Material: Certified mix design and test results. Include material types and weight per cubic yard for each component of mix.

PART 2 PRODUCTS

2.01 GEOTEXTILE

A. As specified in Section 31 32 19.16, Geotextile.

2.02 MARKING TAPE

A. Nondetectable:

1. Inert polyethylene, impervious to known alkalis, acids, chemical reagents, and solvents likely to be encountered in soil.
2. Thickness: Minimum 5 mils.
3. Width: 6 inches.
4. Identifying Lettering: Minimum 1-inch high, permanent black lettering imprinted continuously over entire length.
5. Manufacturers and Products:
   a. Reef Industries; Terra Tape.
   b. Mutual Industries; Non-detectable Tape.
   c. Presco; Non-detectable Tape.
B. Detectable:

1. Solid aluminum foil, visible on unprinted side, encased in protective high visibility, inert polyethylene plastic jacket.
2. Foil Thickness: Minimum 0.35 mils.
3. Laminate Thickness: Minimum 5 mils.
5. Identifying Lettering: Minimum 1-inch high, permanent black lettering imprinted continuously over entire length.
6. Joining Clips: Tin or nickel-coated furnished by tape manufacturer.
7. Manufacturers and Products:
   a. Reef Industries; Terra Tape, Sentry Line Detectable.
   b. Mutual Industries; Detectable Tape.
   c. Presco; Detectable Tape.

C. Color: In accordance with APWA Uniform Color Code.

2.03 TRENCH STABILIZATION MATERIAL

A. Trench stabilization materials must be compatible with trench subgrade. Obtain Engineer’s written approval of trench stabilization material for each material used.

B. For trenches in bedrock, or riprap, or existing geogrid reinforced soil, concrete fill as specified in Section 03 30 00, Cast-in-Place Concrete.

C. For Trenches in Native Soils:

1. Granular Trench Stabilization Material:
   a. Clean gravel or crushed rock, reasonably well-graded from coarse to fine and containing less than 5 percent of weight passing the No. 200 sieve, as determined in accordance with ASTM C136.
   b. Maximum Particle Size: 1.5-inch.
c. Dry sand, accepted by Engineer, may be provided for trenches above maximum groundwater level.

2.04 BEDDING MATERIAL AND PIPE ZONE MATERIAL

A. Unfrozen, friable, and containing no clay balls, roots, or other organic material.

B. Clean or gravelly sand with less than 5 percent passing No. 200 sieve, as determined in accordance with ASTM C136, or gravel or crushed rock within maximum particle size and other requirements as follows unless otherwise specified.

1. Duct Banks: 3/4-inch maximum particle size.
2. PVC Irrigation System Piping and Ductile Iron Pipe with Polyethylene Wrap: 3/8-inch maximum particle size.
4. Pipe 18-Inch Diameter and Greater: 1-1/2-inch maximum particle size for ductile iron pipe, concrete pipe, welded steel pipe, and pretensioned or prestressed concrete cylinder pipe.
5. Perforated Pipe: Granular drain material.
6. Conduit and Direct-Buried Cable:
   a. Sand, clean or clean to silty, less than 12 percent passing No. 200 sieve.
   c. Maximum Size Particle: Pass a No. 4 sieve.
   d. If more than 5 percent passes No. 200 sieve, the fraction that passes No. 40 sieve shall be nonplastic as determined in accordance with ASTM D4318.

C. Concrete Fill as described in Section 03 30 00, Cast-in-Place Concrete, shall be used for bedding and pipe zone material where shown and in the following locations:

1. Grouted core rock.
2. Sculpted concrete.
3. Riprap and riprap bedding.
5. Slopes steeper than 4 horizontal to 1 vertical.

2.06 EARTH BACKFILL

A. Also referred to as earthfill.
B. Sandy soil, sediment, other excavated material suitable for use as backfill.
C. Less than 20 percent fines (passing the No. 200 sieve) as determined by ASTM C136.
D. Free from roots or organic matter, refuse, boulders, or other deleterious materials.
E. Free from boulders, cobbles, or other coarse materials that would be retained on a 3-inch screen.

2.07 CONTROLLED LOW STRENGTH MATERIAL (CLSM)

A. Select and proportion ingredients to obtain compressive strength between 50 psi and 150 psi at 28 days in accordance with ASTM D4832.

B. Materials:

1. Cement: ASTM C150/C150M, Type I or Type II.
3. Fly Ash (Pozzolan): Class F fly ash in accordance with ASTM C618, except as modified herein:
   a. ASTM C618, Table 1, Loss on Ignition: Unless permitted otherwise, maximum 3 percent.
   b. Test in accordance with ASTM C1012/C1012M to verify sulfate resistance is acceptable.
4. Water: Clean, potable, containing less than 500 ppm of chlorides.
2.08 CONCRETE BACKFILL

A. Provide as specified in Section 03 30 00, Cast-in-Place Concrete.

B. Mix: ASTM C94/C94M, Option A.
   1. Cement: ASTM C150/C150M, Type I or Type II.
   2. Coarse Aggregate Size: 3/4-inch.
   3. Design for Minimum Compressive Strength at 28 Days: 3,000 psi.

2.09 SOURCE QUALITY CONTROL

A. Perform gradation analysis in accordance with ASTM C136 for:
   1. Earth backfill, including specified class.
   2. Trench stabilization material.
   3. Bedding and pipe zone material.

B. Certify Laboratory Performance of Mix Designs:
   1. CLSM.
   2. Concrete fill.

PART 3 EXECUTION

3.01 TRENCH PREPARATION

A. Water Control:
   1. Promptly remove and dispose of water entering trench as necessary to grade trench bottom and to compact backfill and install manholes, pipe, conduit, direct-buried cable, or duct bank. Do not place concrete, lay pipe, conduit, direct-buried cable, or duct bank in water.
   2. Remove water in a manner that minimizes soil erosion from trench sides and bottom and protects bedrock, if encountered, from disturbance.
   3. Provide continuous water control until trench backfill is complete.

B. Remove foreign material and backfill contaminated with foreign material that falls into trench.

3.02 TRENCH BOTTOM

A. Firm Subgrade: Grade with hand tools, remove loose and disturbed material, and trim off high areas and ridges left by excavating bucket teeth. Allow space for bedding material if shown or specified.
B. Soft Subgrade: If subgrade is encountered that may require removal to prevent pipe settlement, notify Engineer. Engineer will determine depth of overexcavation, if any required, and appropriate material for replacement.

C. Bedrock Subgrade: If subgrade is bedrock, clean bottom and sides of bedrock trench to remove all sand, debris, mud, loose rocks, or other materials. Excavate bedrock with maximum 4-foot vertical cut. Bench excavation such that overall excavation has average slope of 0.5 horizontal to 1 vertical. Soil over bedrock shall be sloped and include a bench at bedrock contact.

3.03 GEOTEXTILE INSTALLATION

A. Where shown and as specified in Section 31 32 19.16, Geotextile, except as follows:

1. Extend geotextile for full width of trench bottom and up the trench wall to the top of the pipe zone, or base material for manholes and miscellaneous structures.
2. Anchor geotextile trench walls prior to placing trench stabilization or bedding material.
3. Provide 24-inch minimum overlap at joints.

3.04 TRENCH STABILIZATION MATERIAL INSTALLATION

A. Rebuild trench bottom with trench stabilization material.

B. Place material over full width of trench in 6-inch lifts to required grade, providing allowance for bedding thickness.

C. Compact each lift so as to provide a firm, unyielding support for the bedding material prior to placing succeeding lifts. Concrete fill, if used at Engineer’s direction, does not require compaction.

3.05 BEDDING

A. Furnish imported bedding material where, in the opinion of Engineer, excavated material is unsuitable for bedding or insufficient in quantity.

B. Confirm bedding material selection with Engineer prior to placement. Concrete backfill is required for bedding in bedrock, grouted core rock and sculpted concrete.

C. Place over full width of prepared trench bottom in two equal lifts when required depth exceeds 8 inches.

D. Hand grade and compact each lift to provide a firm, unyielding surface.
E. Minimum Thickness:

1. As follows, except use concrete backfill in areas of bedrock, grouted core rock, or sculpted concrete:
   a. Pipe 15 Inches and Smaller: 4 inches.
   b. Pipe 18 Inches to 36 Inches: 6 inches.
   c. Pipe 42 Inches and Larger: 8 inches.
   d. Conduit: 3 inches.
   e. Direct-Buried Cable: 3 inches.
   f. Duct Banks: 3 inches.

F. Check grade and correct irregularities in bedding material. Loosen top 1 inch to 2 inches of compacted bedding material with a rake or by other means to provide a cushion before laying each section of pipe, conduit, direct-buried cable, or duct bank.

G. Install to form continuous and uniform support except at bell holes, if applicable, or minor disturbances resulting from removal of lifting tackle.

H. Bell or Coupling Holes: Excavate in bedding at each joint to permit proper assembly and inspection of joint and to provide uniform bearing along barrel of pipe or conduit.

3.06 BACKFILL PIPE ZONE

A. Upper limit of pipe zone shall not be less than following:

1. Pipe: 12 inches, unless shown otherwise.
2. Conduit: 3 inches, unless shown otherwise.
3. Direct-Buried Cable: 3 inches, unless shown otherwise.
4. Duct Bank: 3 inches, unless shown otherwise.

B. Restrain pipe, conduit, cables, and duct banks as necessary to prevent their movement or buoyant uplift during backfill operations.

C. Place material simultaneously in lifts on both sides of pipe and, if applicable, between pipes, conduit, cables, and duct banks installed in same trench.

1. Pipe 10-Inch and Smaller Diameter: First lift less than or equal to 1/2 pipe diameter.
2. Pipe Over 10-Inch Diameter: Maximum 6-inch lifts.

D. Thoroughly tamp each lift, including area under haunches, with handheld tamping bars supplemented by “walking in” and slicing material under haunches with a shovel to ensure voids are completely filled before placing each succeeding lift.
E. Do not use power-driven impact compactors to compact pipe zone material. After full depth of pipe zone material has been placed as specified, compact material by a minimum of three passes with a vibratory plate compactor only over area between sides of pipe and trench walls. Take care to avoid damaging pipe and pipe coating.

3.07 MARKING TAPE INSTALLATION

A. Continuously install marking tape along centerline of buried piping, on top of last lift of pipe zone material unless otherwise shown on Drawings. Coordinate with piping installation drawings.

1. Detectable Marking Tape: Install with nonmetallic piping and waterlines.

3.08 BACKFILL ABOVE PIPE ZONE

A. General:

1. Process excavated material to meet specified gradation requirements.
2. Adjust moisture content as necessary to obtain specified compaction.
3. Do not allow backfill to free fall into trench or allow heavy, sharp pieces of material to be placed as backfill until after at least 2 feet of backfill has been provided over top of pipe.
4. Do not use power driven impact type compactors for compaction until at least 4 feet of backfill is placed over top of pipe.
5. Backfill to grade with proper allowances for topsoil, crushed rock surfacing, and pavement thicknesses, wherever applicable.
6. Backfill around structures with same class backfill as specified for adjacent trench, unless otherwise shown or specified.

B. Concrete Backfill:

1. Place above bedding.
2. Minimum Concrete Thickness: 6 inches on top and sides of pipe.
3. Do not allow dirt or foreign material to become mixed with concrete during placement.
4. Allow sufficient time for concrete to reach initial set before additional backfill material is placed in trench.
5. Prevent flotation of pipe.
6. Begin and end concrete backfill within 4 inches of a pipe joint on each end.
7. Do not encase pipe joints except within the limits of the concrete backfill.
C. Controlled Low Strength Material:
   1. Discharge from truck mounted drum type mixer into trench.
   2. Place in lifts as necessary to prevent uplift (flotation) of new and existing facilities.
   3. In traveled areas fill entire trench section to pavement finish grade for a temporary driving surface, and screed off excess and finish with a float.
   4. In other areas fill trench section as shown.

3.09 REPLACEMENT OF TOPSOIL
   A. Replace topsoil in top 6 inches of backfilled trench, unless otherwise shown.
   B. Maintain finished grade of topsoil even with adjacent area and grade as necessary to restore drainage.

3.10 MAINTENANCE OF TRENCH BACKFILL
   A. After each section of trench is backfilled, maintain surface of backfilled trench even with adjacent ground surface until final surface restoration is completed.
   B. Gravel Surfacing Rock: Add gravel surfacing rock where applicable and as necessary to keep surface of backfilled trench even with adjacent ground surface, and grade and compact as necessary to keep surface of backfilled trenches smooth, free from ruts and potholes, and suitable for normal traffic flow.
   C. Topsoil: Add topsoil where applicable and as necessary to maintain surface of backfilled trench level with adjacent ground surface.
   D. Other Areas: Add excavated material where applicable and keep surface of backfilled trench level with adjacent ground surface.

3.11 SETTLEMENT OF BACKFILL
   A. Settlement of trench backfill, or of fill, or facilities constructed over trench backfill will be considered a result of defective compaction of trench backfill.

END OF SECTION
SECTION 31 32 19.16
GEOTEXTILE

PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards that may be referenced in this section:

1. ASTM International (ASTM):
   g. D4716, Test Method for Determining the (In-Plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head.
   n. D6193, Standard Practice for Stitches and Seams.
1.02 DEFINITIONS

A. Fabric: Geotextile, a permeable geosynthetic comprised solely of textiles.

B. Maximum Average Roll Value (MaxARV): Maximum of series of average roll values representative of geotextile furnished.

C. Minimum Average Roll Value (MinARV): Minimum of series of average roll values representative of geotextile furnished.

D. Nondestructive Sample: Sample representative of finished Work, prepared for testing without destruction of Work.

E. Overlap: Distance measured perpendicular from overlapping edge of one sheet to underlying edge of adjacent sheet.

F. Seam Efficiency: Ratio of tensile strength across seam to strength of intact geotextile, when tested according to ASTM D4884.

1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Manufacturer material specifications and product literature.
   b. Installation drawings showing geotextile sheet layout, location of seams, direction of overlap, and sewn seams.
   c. Description of proposed method of geotextile deployment, sewing equipment, sewing methods, and provisions for holding geotextile temporarily in place until permanently secured.

2. Samples:
   a. Geotextile and Geogrid: One-piece, minimum 18 inches long, taken across full width of roll of each type and weight of geotextile furnished for Project. Label each with brand name and furnish documentation of lot and roll number from which each Sample was obtained.
   b. Field Sewn Seam: 5-foot length of seam, 12 inches wide with seam along center, for each type and weight of geotextile.
   c. Securing Pin and Washer: One each.

B. Informational Submittals:

1. Certifications from each geotextile manufacturer that furnished products have specified property values. Certified property values shall be either minimum or maximum average roll values, as appropriate, for geotextiles furnished.
2. Field seam efficiency test results.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Deliver each roll with sufficient information attached to identify it for inventory and quality control.

B. Handle products in manner that maintains undamaged condition.

C. Do not store products directly on ground. Ship and store geotextile with suitable wrapping for protection against moisture and ultraviolet exposure. Store geotextile in way that protects it from elements. If stored outdoors, elevate and protect geotextile with waterproof cover.

1.05 SCHEDULING AND SEQUENCING

A. Where geotextile is to be laid directly upon ground surface, prepare subgrade as specified in Section 31 23 13, Subgrade Preparation, first.

B. Notify Engineer whenever geotextiles are to be placed. Do not place geotextile without Engineer’s approval of underlying materials.

PART 2 PRODUCTS

2.01 NONWOVEN GEOTEXTILE

A. Heavy fabric for reinforcement, filtration, and separation use on the East Bank, riprap, and other locations where shown.

B. Pervious sheet of polyester, polypropylene, or polyethylene fabricated into stable network of fibers that retain their relative position with respect to each other. Nonwoven geotextile shall be composed of continuous or discontinuous (staple) fibers held together through needle-punching, spun-bonding, thermal-bonding, or resin-bonding.

C. Geotextile Edges: Selvaged or otherwise finished to prevent outer material from pulling away from geotextile.

D. Unseamed Sheet Width: Minimum 8 feet.

E. Nominal Weight per Square Yard: 16 ounces per ASTM D5261.
F. Physical Properties: Conform to requirements in Table No. 1.

2.02 WOVEN GEOTEXTILE

A. Heavy fabric for use in subgrade reinforcement and stabilization below temporary construction access roads and entrances and other locations shown.

B. Composed of polymeric yarn interlaced to form planar structure with uniform weave pattern.

C. Calendared or finished so yarns will retain their relative position with respect to each other.

D. Polymeric Yarn: Long-chain synthetic polymers (polyester or polypropylene) with stabilizers or inhibitors added to make filaments resistant to deterioration due to heat and ultraviolet light exposure.

E. Sheet Edges: Selvaged or finished to prevent outer material from separating from sheet.

F. Unseamed Sheet Width: Minimum 12 feet.

G. Nominal Weight per Square Yard: 6 ounces per ASTM D5261.
H. Physical Properties: Conform to requirements in Table No. 2.

2.03 GEOSYNTHETICS FOR REINFORCED SOIL SLOPE

A. Existing reinforced soil slope on the East Bank is reinforced using primary and secondary geogrid fabrics, geotextile fabrics, placement of engineered fill, and other materials.

B. Refer to Design Drawings and Specifications for Gathering Place Reinforced Soil Slope, dated April 2015.

C. New geogrid reinforcement materials used to repair damage to the reinforced soil slope incurred during required project excavations shall meet or exceed the minimum requirements of the following products, which are included within the existing reinforced soil slope:

1. Secondary Geogrid: Miragrid 3XT and Miragrid 8XT geogrid manufactured by Tencate Geosynthetics.
2. Primary Geogrid: Mirafi BXG110 manufactured by Tencate Geosynthetics.
ZINK DAM IMPROVEMENTS

2.04 GEOTEXTILE CUSHION SAND
   A. Refer to Section 31 23 23, Fill and Backfill.

2.05 SEWING THREAD
   A. Polypropylene, polyester, or Kevlar thread.
   B. Durability: Equal to or greater than durability of geotextile sewn.

2.06 SECURING PINS
   A. Steel Rods or Bars:
      1. 3/16-inch diameter.
      2. Pointed at one end.
      3. With head on other end sufficiently large to retain washer.
   B. Steel Washers for Securing Pins:
      1. Outside Diameter: Not less than 1.5 inches.
      2. Inside Diameter: 1/4-inch.
   C. Steel Wire Staples:
      1. U-shaped.
      2. 10 gauge.

PART 3 EXECUTION

3.01 LAYING GEOTEXTILE
   A. Lay and maintain geotextile smooth and free of tension, folds, wrinkles, or creases.

3.02 SHEET ORIENTATION ON SLOPES
   A. Orient geotextile with long dimension of each sheet parallel to direction of slope.
   B. Geotextile may be oriented with long dimension of sheet transverse to direction of slope only if sheet width, without unsewn seams, is sufficient to cover entire slope and anchor trench and to extend at least 18 inches beyond toe of slope.
3.03 JOINTS

A. Unseamed Joints:
   
   1. Overlapped.
   2. Overlap, unless otherwise shown:
      b. Riprap: Minimum 24 inches.
      c. East Bank Modifications: 24 inches.
      d. Drain Trenches: Minimum 18 inches, except overlap shall equal trench width if trench width is less than 18 inches.
      e. Other Applications: Minimum 12 inches.

B. Sewn Seams: Made wherever stress transfer from one geotextile sheet to another is necessary. Sewn seams, as approved by Engineer, also may be used instead of overlap at joints for applications that do not require stress transfer.

   1. Seam Efficiency:
      a. Minimum 70 percent.
      b. Verified by preparing and testing minimum of one set of nondestructive Samples per acre of each type and weight of geotextile installed.
      c. Tested according to ASTM D4884.
   2. Types:
      a. Preferred: “J” type seams.
      b. Acceptable: Flat or butterfly seams.
   3. Stitch Count: Minimum three to maximum seven stitches per inch.
   4. Stitch Type: Double-thread chainstitch according to ASTM D6193.
   5. Sewing Machines: Capable of penetrating four layers of geotextile.
   6. Stitch Location: 2 inches from geotextile sheet edges, or more, if necessary to develop required seam strength.

3.04 SECURING GEOTEXTILE

A. Secure geotextile during installation as necessary with sandbags or other means approved by Engineer.

B. Secure Geotextile with Securing Pins or Staples:

   1. Insert securing pins with washers through geotextile.
   2. Securing Pin Alignment:
      a. Midway between edges of overlaps.
      b. 6 inches from free edges.
3. Spacing of Securing Pins:

<table>
<thead>
<tr>
<th>Slope</th>
<th>Maximum Pin Spacing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steeper than 3:1</td>
<td>2 feet</td>
</tr>
<tr>
<td>3:1 to 4:1</td>
<td>3 feet</td>
</tr>
<tr>
<td>Flatter than 4:1</td>
<td>5 feet</td>
</tr>
</tbody>
</table>

4. Install additional pins across each geotextile sheet as necessary to prevent slippage of geotextile or to prevent wind from blowing geotextile out of position.

5. Push each securing pin through geotextile until washer bears against geotextile and secures it firmly to subgrade.

6. Where staples are used instead of securing pins, install in accordance with alignment and spacing above. Push in to secure geotextile firmly to subgrade.

3.05 PLACING PRODUCTS OVER GEOTEXTILE

A. Before placing material over geotextile, notify Engineer. Do not cover installed geotextile until after Engineer provides authorization to proceed.

B. Do not place materials over geotextile which could cut or tear fabric. Include allowances for geotextile cushion sand. Refer to Section 31 23 23, Fill and Backfill.

C. If tears, punctures, or other geotextile damage occurs during placement of overlying products, remove overlying products as necessary to expose damaged geotextile. Repair damage as specified in Article Repairing Geotextile.

3.06 INSTALLING GEOTEXTILE IN TRENCHES

A. Place geotextile in a way to completely envelope granular drain material to be placed in trench and with specified overlap at joints. Overlap geotextile in direction of flow. Place geotextile in a way and with sufficient slack for geotextile to contact trench bottom and sides fully when trench is backfilled.

B. After granular drain material is placed to required grade, fold geotextile over top of granular drain material, unless otherwise shown. Maintain overlap until overlying fill or backfill is placed.
3.07 RIPRAP APPLICATIONS

A. Overlap geotextile at each joint with upstream sheet of geotextile overlapping downstream sheet.

B. Limit height of riprap fall onto geotextile to 0 feet to prevent damage.

C. Include two layer aggregate riprap bedding wherever riprap is placed upon geotextile, refer to Section 31 37 00, Riprap.

3.08 SILT FENCE APPLICATIONS

A. Install geotextile in one piece, or continuously sewn to make one piece, for full length and height of fence, including portion of geotextile buried in toe trench.

B. Install bottom edge of sheet in toe trench and backfill in a way that securely anchors geotextile in trench.

C. Securely fasten geotextile to wire mesh backing and each support post in a way that will not result in tearing of geotextile when fence is subjected to service loads.

D. Promptly repair or replace silt fence that becomes damaged.

3.09 REPAIRING GEOTEXTILE

A. Repair or replace torn, punctured, flawed, deteriorated, or otherwise damaged geotextile.

B. Repair Procedure:

1. Place patch of undamaged geotextile over damaged area and at least 24 inches in all directions beyond damaged area.

2. Remove interfering material as necessary to expose damaged geotextile for repair.

3. Sew patches or secure them with heat fusion tacking or with pins and washers, as specified above in Article Securing Geotextile, or by other means approved by Engineer.

3.10 REPAIRING REINFORCED SOIL SLOPE

A. Repair and reconstruct damaged existing reinforced soil slope located with the East Bank which will be damaged by Contractor during required and excavations.
B. Submit repair procedure describing proposed approach to repair existing slope, including replacement of backfill materials, geotextile, geogrid, cushion sands, riprap, drainage materials, and other features contained within the slope. Repair procedure shall be based upon review of:

2. Documentation of excavation into reinforced soil slope, refer to Section 31 23 16, Excavation.
3. Construction and protection of project components which necessitated excavation into reinforced soil slope.

C. Repair reinforced soil slope which is damaged or disturbed by Contractor, due to approved excavations to stable permanent configuration.

D. Conform to manufacturer’s recommendations for repair of geogrid and geotextile fabrics.

E. Obtain Engineer’s approval prior to initiating repair.

3.11 REPLACING CONTAMINATED GEOTEXTILE

A. Protect geotextile from contamination that would interfere, in Engineer’s opinion, with its intended function. Remove and replace contaminated geotextile with clean geotextile.

END OF SECTION
SECTION 31 35 00
START-UP AND TUNING

PART 1 GENERAL

1.01 DESCRIPTION

A. The work of this Section consists of the Start-up and Tuning, including interim and final modifications of in-river recreational features and grading. Iterative trials and testing, modifications, and adjustments to WaveShapers, blocks, sculpted rock, and modifications and additions to boulders surfacing, jetties, and other features in and around the drops and pools are anticipated after initial start-up and observation. The intent of the start-up and tuning effort is to optimize performance and improve operational ease and safety.

1.02 JOB CONDITIONS

A. Protection of Structures, Banks, Riverbed and Vegetation: All structures, final grading, existing banks, riverbed, and existing natural vegetation both inside and outside of the Project boundaries shall be protected from injury during modifications and operational tuning of the Project. Any damage to such facilities or resources shall be repaired by the Installation Contractor to a condition equal to or better than original at no additional expense to the Owner. Any required repairs shall be made to the satisfaction of the Engineer.

B. Permits: The Installation Contractor shall be responsible for adhering to all permits associated with or obtained for the Project during any work carried out under the Modifications phase of the Project.

C. Water Control: The Installation Contractor shall be responsible for all elements of water control required to carry out the work covered by this Section of the Specifications.

D. Coordination: The Installation Contractor shall coordinate with the Owner during the execution of the tuning. Following substantial completion of the Project the Installation Contractor shall provide notice to the Owner and Engineer.

1.03 RELATED WORK

A. Section 03 30 00, Cast-in-Place Concrete.

B. Section 03 45 39, Sculpted Concrete.

C. Section 31 10 00, Site Clearing.
ZINK DAM IMPROVEMENTS

D. Section 31 23 13, Subgrade Preparation.
E. Section 31 23 16, Excavation.
F. Section 31 23 19.01, Dewatering.
G. Section 31 23 23, Fill and Backfill.
H. Section 31 23 23.15, Trench Backfill
I. Section 31 38 00, Rock.
J. Section 31 41 00, Shoring.

PART 2 PRODUCTS

2.01 RELATED WORK

A. As required for the various related Work, see Paragraph Related Work. This is applicable to final/permanent modifications determined during and after completion of the iterative testing, and as required to support the individual trials and testing.

2.02 ITERATIVE TRIALS

A. As required to support iterative testing and trials, including temporary wood structures (plywood, framing wood, concrete anchors, etc.) anchored to concrete and rock and sandbags to temporarily direct flows. Installation Contractor should assume at least $10,000 worth of direct materials costs (unburdened, locally available but not delivered) for these miscellaneous temporary structures used in the iterative testing. Installation Contractor will keep receipts and provide itemized list on an on-going basis for all such materials.

PART 3 EXECUTION

3.01 GENERAL

A. Iterative trials, temporary and permanent structure, modifications to previous work, and adjustments to WaveShapers and appurtenances, pool banks, jetties, etc. Work shall support:

1. Interim Trials and Testing: Temporary structures to guide flow during iterative trials (plywood, sandbags, etc.), and some final installation of Sculpted Rock, and Grouted Boulders. Grout, modifications of jetties, and other features in and around the drops and pools using temporary obstructions with final addition of boulders and/or sculpted rock.
2. Final Modifications: After trials are completed, some of the final work to finish and replace temporary structures is anticipated.

3.02 START-UP AND TUNING

A. The Project shall be rewatered and initial operation of improvements completed. Specific requirements include that the river will be observed at normal flow rates during start-up. Therefore, work in start-up will have to be scheduled once flows in the river are within the range of 50 cfs to 600 cfs. Adequate operating time for the Engineer to observe, survey and complete documentation shall be allowed for all trials (up to 2 hours to 8 hours for each day of tuning). During these operational periods, and to implement interim and final modifications, the Installation Contractor shall supply a representative to communicate with the describe aspects of the Project and assist the Engineer with observation and documentation of the start-up.

3.03 SCHEDULE

A. The Installation Contractor shall coordinate, schedule, and supply all labor and materials, miscellaneous materials, and equipment, to support the start-up and tuning effort and construct all temporary/interim modifications and structures, and construct all Final Modifications.

3.04 TUNING AND MODIFICATIONS

A. WaveShaper and Appurtenances: Including opening and closing of any vents, installation and movement of all blocks, installing and adjusting apparatus that is designed to be adjusted or modified, adjustment to sides (shoulders) of WaveShaper (or drop) structures; installation and movement of pool blocks.

B. Tuning blocks shall be attached to the WaveShaper or drop structure foundations and in the pool prior to start-up as directed by the Engineer, or as shown on Drawings. During Start-up, the Engineer will evaluate needed modifications to the tuning block configurations or tuning block shapes/sizes or foundation to achieve the desired hydraulic. The Installation Contractor shall attach new tuning blocks, rearrange original blocks, or a combination of the two as directed by the Engineer. There are three types of tuning blocks; invert blocks, pool blocks, and shoulder blocks. The geometries, details, and anticipated quantities required for each type of block is provided on Drawings.

C. Tuning Areas: Areas adjacent to each side of the WaveShaper or drop structure foundations have been included in the design to allow placement of sculpted concrete, temporary wood structures, sand bags, and/or tuning blocks for tuning as delineated on Drawings. The Engineer will evaluate the tuning areas during Start-up and provide recommended modifications. It should be
expected that two iterations/configurations within the tuning areas will be required.

D. Adjustments to Grouted Boulders, and Loose Boulders, Sculpted Concrete, and Riverbed: Shape and sizes of individual surface boulders and excavated bedrock vary significantly and some adjustment to, or replacement of, individual boulders, and bedrock areas may be required to achieve performance goals for the overall Project. An initial configuration of loose and grouted boulders as shown on Drawings shall be installed by the Installation Contractor unless otherwise directed by the Engineer prior to start-up. The Engineer will evaluate the tuning areas during start-up and provide recommended modifications. Loose and grouted boulders shall be reworked by the Installation Contractor as directed by the Engineer. It should be expected that two loose and/or grouted boulder configurations in the tuning areas will be required. The Installation Contractor shall exercise proper care in the replacement and/or adjustment of individual boulders so that all other portions of the Project remain undamaged.

E. Time Period for Modifications: The Installation Contractor shall be responsible for providing all materials, equipment and personnel required to facilitate observation of performance and carry out Modifications as directed by the Engineer for a period up to 2 months following completion of Project construction. At a minimum, it is anticipated that a 1-month period will be required for observation of performance with more moderate interim structures and temporary modifications and Engineer recommended modifications, and second 1-month period for more extensive modifications and adjustments.

F. Payment Methods for Tuning Modifications: Following the start-up, the Engineer will prepare memorandums and sketches detailing requested Modifications. Tuning and modifications of tuning areas and WaveShaper (including furnishing blocks) shall be included in the Installation Contractors Lump Sum Bid Price. Other Items requiring modifications for tuning will be paid for by negotiating change orders based on existing unit prices in the Schedule of Values provided by the Installation Contractor. If the required adjustment is a result of workmanship that does not meet the tolerances for grades or the dimensions provided on Drawings, the costs of adjustment will be borne by the Installation Contractor.

END OF SECTION
PART 1  GENERAL

1.01  REFERENCES

A.  The following is a list of standards which may be referenced in this section:

   1.  ASTM International (ASTM):
       e.  D5519, Standard Test Methods for Particle Size Analysis of Natural and Man-Made Riprap Materials.

1.02  DEFINITIONS

A.  Refer to applicable definitions in Section 31 23 23, Fill and Backfill.

B.  Standard Specifications, where described in this section, refer to 2009 Edition of Oklahoma State Department of Transportation Specifications for Roadway Construction.

1.03  SUBMITTALS

A.  Action Submittals:

   1.  Shop Drawings:
       a.  Description and location of proposed sources for procuring riprap bedding and riprap.
       b.  For each source proposed, provide description and location of three projects where proposed riprap has been successfully used for minimum 5 years’ duration under similar service conditions.

   2.  Samples:
       a.  General:
           1)  Deliver to Site at location designated by Engineer.
               Alternatively, make arrangements for Engineer or designee visit to material source for review and approval of materials.
2) Keep samples onsite for majority of the construction
duration for direct comparison to imported materials for
consistency. Incorporate samples of suitable material into
Work after material placement is nearly complete.
3) Samples of material which do not conform to this
specification and are deemed unacceptable by the Engineer
shall be disposed of offsite at no cost to the Owner.

b. Riprap:
   1) Provide minimum 10 cubic yards of LR07.
   2) Sample shall meet gradation requirements specified for
corresponding riprap type, include at least one piece of
maximum size, and be representative of material to be
furnished for incorporation into Work. Provide measured
gradation of riprap in accordance with ASTM D5519
Method B.

c. Riprap Bedding:
   1) Single layer: Provide minimum 1,000 pounds.
   2) Two-layer:
      a) Upper Course: Provide minimum 1,000 pounds.
      b) Lower Course: Provide minimum 200 pounds.

B. Informational Submittals:

1. Quarry Certificate of Conformance and supporting documentation
   showing proposed riprap bedding or riprap meet Standard Specification
   gradation and materials requirements for the Class or Type specified.
2. Certified Test Results:
   a. Aggregate Riprap Bedding:
      1) Gradation by ASTM D5519 Method B.
      2) Bulk specific gravity and absorption by ASTM D6473.
      3) Abrasion resistance by U.S. Army Corps of Engineers
         Method CRD-C 144.
   b. LR07 Riprap:
      1) Gradation conforming to this specification and measured by
         ASTM D5519 Method B. Submittal shall include including
         photos of material with visual scale reference.
      2) Bulk specific gravity and absorption by ASTM D6473.
      3) Abrasion resistance by U.S. Army Corps of Engineers
         Method CRD-C144.
      4) Provide gradation results from material source every
         500 cubic yards of material delivered to site, or whenever
         material source changes.
3. Trip tickets showing source, type, and weight of each load of material
delivered to Site.
1.04 QUALITY ASSURANCE
A. Riprap Source: Quarry that has produced riprap and has performed satisfactorily on other projects for at least 5 years.
B. Site Visit: Make arrangements for Engineer or designee to visit quarry site to observe materials proposed for riprap and riprap bedding.

1.05 SCHEDULING AND SEQUENCING
A. Complete subgrade preparation as specified in Section 31 23 13, Subgrade Preparation, and geotextile installation, where shown, as specified in Section 31 32 19.16, Geotextile, prior to placing riprap bedding or riprap.

PART 2 PRODUCTS
2.01 AGGREGATE RIPRAP BEDDING
A. Where single layer of riprap bedding is required beneath LR07 riprap, material shall conform to:
   1. Single Course Filter Blanket as defined in Section 713.02 of the Standard Specifications. Place minimum 8 inches thick.
B. Where two-layer riprap bedding is required beneath LR07 riprap, material shall include two layers, conforming to:
   1. Upper Course Filter Blanket Material as defined in Section 713.02 of the Standard Specifications. Place minimum 8 inches thick. This is the upper layer.
   2. Lower Course Filter Blanket Material as defined in Section 713.02 of the Standard Specifications. Place minimum 4 inches thick. This is the lower layer.

2.02 GEOTEXTILE RIPRAP BEDDING
A. Unless otherwise shown or specified, use lower course filter blanket material as a bedding material below geotextile as defined in Section 713.02 of the Standard Specifications. Place minimum 4 inches thick.

2.03 RIPRAP
A. Hard and durable quarry stone free from fractures, bedding planes, pronounced weathering, and earth or other adherent coatings.
B. Minimum Dimension of Individual Pieces: Not less than 1/3 maximum dimension.
C. Abrasion Resistance: Maximum 35 percent wear as determined in accordance with ASTM C535.

D. Bulk Specific Gravity: Minimum 2.5 as measured in accordance with ASTM D6473.

E. Gradation: Smaller pieces shall generally fill voids between larger pieces without either excess or deficiency of one or more sizes of stone.

F. LR07 Riprap Gradation shall fall be between the upper bound and lower bound gradation limits below. Gradation shall be measured in accordance with ASTM D5519 Method B:

<table>
<thead>
<tr>
<th>Upper Bound Particle Size (pounds)</th>
<th>Percent Finer (%)</th>

2.04 GROUTED CORE ROCK

A. Refer to Section 31 38 00, Rock.

PART 3 EXECUTION

3.01 PLACING RIPRAP BEDDING

A. Place riprap bedding, where shown, beneath areas to receive riprap. This requirement does not apply to individual architectural boulders, boulder
clusters, steppers, or other architectural stone placed on the east bank; nor
does it apply to feature boulders installed within the recreational flume.

B. Single Layer Versus Two-Layer Riprap Bedding:

1. Use single layer riprap bedding where shown, generally when placing
riprap over coarse materials such as 4-inch rockfill, and cemented
materials such as bedrock, or grouted core rock.
2. Use two-layer riprap bedding when placing riprap over geotextile and
when placing riprap over native clayey, silty, and sandy soils.

C. Placement Thickness:

2. Double Layer Riprap Bedding:
   a. Lower Course: Minimum 4 inches thick.
   b. Upper Course: Minimum 8 inches thick.

D. No mechanical compaction of riprap bedding is required; however, work
riprap bedding as necessary to distribute it and to eliminate detrimental voids.
Avoid overworking or long pushes that result in segregation of particle sizes.

E. Include allowances for riprap bedding beneath riprap lines and grades shown.

F. Grade surface of riprap bedding free from irregularities and within 0.1 feet
from required grades. Maintain minimum thicknesses required for all
materials.

G. Place and grade riprap bedding in a manner that avoids subgrade disturbance
and displacement or damage to geotextile. Do not push riprap bedding down
slope. If wrinkles form in geotextile as riprap bedding is placed, remove riprap
bedding and correct riprap damage as specified in Section 31 32 19.16,
Geotextile.

H. Place riprap bedding on geotextile without puncturing or damaging geotextile.
If accidentally damaged, repair geotextile prior to proceeding.

3.02 PLACING RIPRAP ON RIPRAP BEDDING

A. Unless riprap is placed directly upon existing riprap, or unless otherwise
shown, riprap shall be placed upon aggregate riprap bedding.

B. Place riprap over riprap bedding to uniform thickness shown. Place riprap
from bottom to top of slope.
C. Intermix different sizes of pieces to eliminate segregation and to fill voids between larger pieces with smaller pieces and work material surface to form a tight interlocking fabric of riprap boulders free from irregularities or loose stones.

D. Final riprap configuration shall include no loose stones which, in the opinion of the Engineer, have the potential to roll down slopes and injure persons below.

E. Use placement and intermixing methods that avoid disturbing prepared subgrade, riprap bedding, and underlying geotextile or damaging existing facilities, completed Work, or adjacent property.

3.03 PLACING GROUTED CORE ROCK

A. Refer to Section 31 38 00, Rock.

END OF SECTION
PART 1 GENERAL

1.01 DESCRIPTION

A. The work of this section consists of installation of water control measures, subgrade preparation, riprap, boulders, boulders to be grouted, grout, weep/underdrains (if included), sculpted rock, and miscellaneous appurtenant items as indicated herein and on Drawings.

B. The terms “boulder grout” or “grout,” when referenced related to grouting rock, boulders, core rock, etc., as used in these specifications, refers to a type of concrete to be used as a filler and cementing agent between boulders. The grout, and all related boulder grout work, shall meet the requirements of this Section and Section 03 30 00, Cast-in-Place Concrete, including, but not limited to: mix design, quality assurance and control, submittals, materials, job conditions, placement, curing and testing. The term “rock” includes all boulders, rip rap, core rock, cobble, and other types defined in Part 2 of this specification. The term “boulders” includes surface boulders, rounded surface boulders, and feature boulders as determined in Part 2 of this specification.

1.02 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03 30 00, Cast-in-Place Concrete.
B. Section 03 45 39, Sculpted Concrete.
C. Section 31 10 00, Site Clearing.
D. Section 31 23 13, Subgrade Preparation.
E. Section 31 23 16, Excavation.
F. Section 31 23 19.01, Dewatering.
G. Section 31 23 23, Fill and Backfill.
H. Section 31 23 23.15, Trench Backfill
I. Section 31 37 00, Riprap.
J. Section 31 41 00, Shoring.
K. Section 33 46 00, Subsurface Drainage.
1.03 SUBMITTALS AND TESTING

A. General: Submittals shall be prepared and submitted in accordance with Section 01 33 00, Submittal Procedures.

B. In advance of delivery of imported rock to the work site an inspection of the quarry or source of any imported rock shall be arranged by the Contractor and shall include the Contractor, Engineer, and Quarry Representative.

C. Rock Work Plan:

1. The Contractor shall prepare a Rock Work Plan for the Project. The plan shall provide the Contractor’s methods and procedures for managing the sourcing, supply, stockpiling, delivery, and installation of rock work for the Project including the following:
   a. Rock shall be imported from a quarry or other source. Identify material sources and expected quantities for each type of rock. Estimated quantities will be made at the earliest time practicable, and the Rock Work Plan will be updated or amended to reflect quantities.
   b. For each type of imported rock, include certificates stating the source of the rock and that the rock will meet the requirements of this section. Include test results for specific gravity, abrasion, gradation and freeze thaw on samples of rock to be supplied on this Project.
   c. For rock that is from a source other than a quarry, methods for identifying suitable rock that meets the requirements defined for each type specified shall be identified and described. The Engineer will provide guidance on identifying rock that is of sufficient quality. Sorting methods that are to be performed on such imported rock (other than from a quarry) shall be identified in the Rock Work plan and shall be shown to produce reliable results.
   d. The Contractor and quarry or rock supplier shall identify procedures that will be used to stockpile, mix and grade the types of riprap and boulders specified.
   e. Sketches or exhibits indicating material stockpile and staging areas.
   f. Describe methodologies and techniques for installation of each rock type. Include the coordination of faux and sculpted rock installations with rock work where applicable.

D. Submit design mix for boulder grout per requirements of Section 03 30 00, Cast-in-Place Concrete.
E. Visual Checking: Boulders shall be visually checked by the Contractor at the quarry or source of imported rock, or at the work site as required for size, elongation, cracks, deterioration and other defects visible on the entire surface area of the stone. If cracks are observed, the Contractor shall notify the Engineer to make a determination as to acceptability of rock. Boulders with cracks or defects that are detrimental to a long-lasting product shall not be shipped to the work site.

F. Sample Installation of Grouted and Loose Boulders: The Contractor will be required to construct a sample installation of grouted and/or loose boulders a minimum of 20 feet by 20 feet for each type and detail (as shown in the Specifications and/or Drawings) of rock used at locations to be designated by the Engineer. The sample installation shall incorporate all aspects of grouted and loose boulder construction and shall be approved by the Engineer before any permanent placement of grouted or loose boulders on the job. The sample areas will serve as a guide for all subsequent boulder installations and remain undisturbed for the entirety of the Project. The Engineer shall be given a minimum of 10 working days’ notice by the Contractor of their intent to construct this sample installation. The sample boulder installation may constitute a portion of the final project at a location approved by the Engineer and shall be constructed only in the presence of the Engineer or their Representative.

PART 2 PRODUCTS
2.01 ROCK

A. General: Rock shall be imported. Imported rock shall be derived from offsite sources such as quarries, pits excavations, or surface sources. Imported rock must meet all the requirements of this section. All rock must be screened and/or sorted and stockpiled into the various rock types to be used on the Project. Graded materials shall be stockpiled in a manner to avoid segregation.

1. All rock and boulders are to be sound and durable against disintegration under conditions to be met in handling and placing. Rock and boulders shall be hard and tenacious and otherwise of a suitable quality to ensure permanency in the specified kind of work. Rock shall be free of calcite intrusions.

2. The color of imported boulders and riprap (other than core rock) shall be gray with gray/blue hues or other acceptable colors approved by the Engineer.

3. For riprap and core rock, each rock/boulder shall have its greatest dimensions not greater than 3 times its least dimension.
4. All rock and boulders shall conform to the following test requirements of the ASTM International (ASTM) and American Association of State Highway and Transportation Officials (AASHTO) Standards:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Testing Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apparent Specific Gravity</td>
<td>2.60 minimum</td>
</tr>
<tr>
<td>Abrasion Loss</td>
<td>40% maximum</td>
</tr>
<tr>
<td>Freeze Thaw Loss</td>
<td>10% maximum after 12 cycles</td>
</tr>
</tbody>
</table>

5. All rock and boulders to be used on the Project must be approved by the Engineer. Once approved, the rock shall be kept consistent through the Project. No change may be made to the rock source unless specifically approved by the Engineer.

B. Types:

1. The following types of rock shall be imported for this Project:
   a. Surface Boulders: To be used for grouted boulder or loose boulder installations in areas where smoothness or aesthetics of finished rock work is desired. The minimum size of surface boulders to be used on this Project is shown on Drawings or details but shall be at least 24 inches in all dimensions.
   b. Feature Boulders: To be used in grouted boulder and loose boulder installations. Feature boulders shall be 4 feet to 10 feet in at least one dimension and no less than 36 inches in any dimension as shown on Drawings. The exact locations, orientation, and type of feature boulders shall be determined during construction by the Engineer. Rounded feature boulders are specified, they shall also meet the requirements specified in Subparagraph Rounded Surface and Feature Boulders below. The estimated distribution (by percentage) of feature boulders and rounded feature boulders (i.e., type) to be installed on the Project is shown in the table below:

<table>
<thead>
<tr>
<th>Estimated Percentage to be Installed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature Boulders</td>
</tr>
<tr>
<td>Rounded Feature Boulders</td>
</tr>
</tbody>
</table>
c. Rounded Surface and Rounded Feature Boulders: Where rounded surface or feature boulders are specified, they shall meet the requirements of surface boulders and the following conditions related to roundness and smoothness. Rounded be defined as having rounded surfaces with no sharp edges on at least three sides or 75 percent of continuous surface area. All rounded surface and feature boulders shall be rounded naturally by prolonged exposure to weather, glaciation, or moving water. Rounded surface and feature boulders shall be natural appearing material and shall be subject to acceptance by the Engineer. Any remaining sharp edges on exposed surfaces of rounded surface boulders and feature boulders shall be mechanically rounded to 3 inches or greater radius unless otherwise directed by the Engineer.

d. Core Rock (Nonexposed or Buried): Rock obtained from sources listed above to be used in grouted boulder installations that are buried or beneath a layer of surface boulders. Core rock shall be angular rock or broken onsite concrete meeting size requirements. Sharp edges are not a concern for buried/nonexposed core rock. Permissible locations for core rock are shown on Drawings. The minimum size of core rock to be used on this Project is 18 inches in any and all dimensions.

e. Core Rock (Exposed): Exposed core rock is to be installed only in the areas below the water surface elevations as delineated on Drawings. Exposed core rock will be imported material only and shall conform to the testing requirements as specified in this article, Paragraph A above. The minimum size of core rock to be used on this Project is 18 inches in any and all dimensions.

f. Concrete Fill Material: Unreinforced concrete fill material shall be placed below structural concrete to fill in voids where prepared subbase is not uniform and where fill areas cannot adhere to the minimum lift thickness of grouted core rock as described in this specification or on Drawings. Concrete fill material shall be installed as indicated in the Contract Documents or as specified in the field by the Engineer. Refer to Section 03 30 00, Cast-in-Place Concrete, for specifications regarding concrete fill material.

C. Quality Control: The Contractor shall manage the delivery and stockpiling of rock at the site to assure that adequate supply of rock meeting the specification is available for installation when required. Stockpile locations shall be arranged to avoid interference with other project operations. Rock which does not meet specifications or is not installed shall be removed from the site.
2.02 BOULDER GROUT (GROUT)

A. Concrete used for grouted rocks and boulders, “boulder grout” or “grout,” shall be an approved batch and meet all requirements of Section 03 30 00, Cast-in-Place Concrete, as modified below.

B. Strength and General Requirements:

1. Design and proportion boulder grout to meet the following minimum compressive strengths and other criteria.

<table>
<thead>
<tr>
<th>Location</th>
<th>Aggregate Size inch (ASTM C33 size)</th>
<th>Design Strength 28-day (psi)</th>
<th>Required Strength 7-day (psi)</th>
<th>Slump ± 1-inch</th>
<th>Minimum Cement Content* (lbs/yd)</th>
<th>Flyash Content</th>
<th>Maximum Water Cement Ratio*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boulder Grout **</td>
<td>3/8 – (No.8)</td>
<td>4,500</td>
<td>3,000</td>
<td>2-10</td>
<td>611</td>
<td>20% max.</td>
<td>0.38</td>
</tr>
</tbody>
</table>

* The maximum water-cementitious materials ratio by weight, which shall be based on all water in the mix, including correction for moisture in aggregates, and shall be based on the total cementitious materials including cement and fly ash, if any.

** Add synthetic fiber reinforcement. See Admixtures.

2. Entrained Air for Boulder Grout: Entrained air, 6 plus or minus 1-1/2 percent for ASTM C33 Size 67 or Size 57 coarse aggregate. Refer to ACI 301 for air entrainment required for other coarse aggregate sizes.

3. The slump of the boulder grout will be adjusted depending on the number of rock or boulder layers grouted in a single pour. All boulder grout shall meet the specified requirements for slump, durability, strength, water-cement ratio and other properties. Boulder grout slump shall vary per the following table:

<table>
<thead>
<tr>
<th>Boulder Grout Location</th>
<th>Slump</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single Boulder Layer</td>
<td>2” to 6”</td>
</tr>
<tr>
<td>Multiple Boulder Layer</td>
<td>6” to 10”</td>
</tr>
</tbody>
</table>

4. When boulder grout arrives at the Project with slump below 1 inch, first the boulder grout shall be remixed for at least 1 minute at mixing speed; if the slump is still too low, water may be added only if the maximum permissible water-cement ratio is not exceeded. The water-cement ratio must be verified by truck batch tickets and corrections for moisture in the aggregates. The water must be incorporated by additional mixing equal to at least half of the total mixing required. Any water addition must be reviewed and approved by the Engineer.
5. When grouting multiple boulder layers, boulder grout shall arrive at the job site at a slump of less than 2 inches, be verified, then the high-range water-reducing admixture (super-plasticizer) added to increase the slump to the approved level for placement. Water shall not be added for this purpose. Contractor shall review recommendations of the admixture supplier and ready-mix producer with Engineer. Batch plant additions of part or the entire high-range water-reducing admixture may be considered if found acceptable by the Engineer and if shown to produce equal or better results.

6. Slump shall be adjusted by the Contractor within the ranges given above to assure complete penetration of the boulder grout through each rock layer and into the layer below.

7. Do not retemper mix by adding water once slump is attained in each truck load.

C. Boulder Grout Admixtures:

1. Fibrous Concrete Reinforcement: Per Section 03 30 00, Cast-in-Place Concrete.

2. Color Additives for Boulder Grout: When indicated on Drawings or Specifications, boulder grout shall have integral color pigments added to the mix and be as manufactured by Davis Colors, “or-equal,” at the rates indicated as acceptable following sample panel installation.
   a. Colored additives shall contain pure, concentrated mineral pigments specially processed for mixing into concrete and complying with ASTM C979.
   b. Color additives containing carbon black are not acceptable. Black and Gray coloring shall be obtained using black iron oxide pigments.
   c. The Contractor shall determine exact color or combination of colors to be added to mimic the natural rock of the Project and construct sample panel for approval by the Engineer. Color samples shall be submitted to the Engineer prior to sample panel construction.
   d. Dosage rates shall typically be between 3 percent and 5 percent and shall not exceed 10 percent of weight of cementitious materials mix. Contractor shall determine the exact dosage required to produce boulder grout to mimic the natural rock of the Project as per manufacturer recommendations and Engineer approval.
e. Meter and dispense colors using computer-controlled automated color weighing and dispensing systems provided by the manufacturer of the color additive. As an alternative, manual dispensing may be used and accomplished by addition of premeasured disintegrating bags. Particular attention must be given to thorough mixing of concrete after addition of the color additives.

D. Surface Treatment and Finishes:

1. Boulder grout shall be finished using dry shake color hardeners, stain, and sealant where shown on Drawings or as specified below.

2. Dry Shake Color Hardeners: Color hardeners, where indicated on Drawings or in the Specifications, shall be as manufactured by Brickform, “or-equal,” at the manufacturer recommended application rates or as approved following sample panel(s) installation.
   a. The Contractor shall determine exact color or combination of colors to be applied to mimic the natural rock of the Project and construct sample panel for approval by the Engineer. Color samples shall be submitted to the Engineer prior to sample panel construction.
   b. Boulder Grout Color: Dry shake color hardener shall be applied to the 75 percent of the boulder grout surface area above “Low Water Level” as defined by the lowest invert elevation of the next drop structure downstream as shown on Drawings. Coloring shall be applied randomly to create variegation of colors, hues, and shades similar to natural rock. Apply per manufacturer’s recommendations and approved sample panel installation.

3. Stain and Sealant: Concrete stain, where required by Drawings or Specifications, shall be as recommended by the Contractor to meet the following requirements.
   a. Create base colors, and color variations that are deemed acceptable following test panel production.
   b. Accurately simulate hues, streaking and coloration matching onsite bedrock boulders.
   c. Must maintain color (little to no fading) in submerged conditions or direct sunlight.
   d. Following staining, the finish shall be sealed with sealant recommended by the Contractor and stain manufacturer, and shall meet the following requirements:
      1) No discoloration with exposure to sunlight.
      2) Increase durability by limiting water penetration.
      3) Preserve color of original stain.
   e. Stain and sealants shall be applied per manufacturer recommendation.
E. Coloring and Finishes Summary: See the information in the following table for a summary of the coloring and finishes requirements for this Project.

<table>

2.03 SOIL MIXTURE FOR VOIDS

A. Onsite material for placement where shown on Drawings or specified, such as in loose boulder mats, and loose/terraced boulders, voids shall be free from trash and organic debris and shall be approved by the Engineer before use.

B. Organic Compost (Soil Amendment): Where soil mixture is placed a minimum of 18 inches from the surface and 18 inches above the invert of the river or channel, or as shown on Drawings, an organic compost soil amendment shall be used. Use a well decomposed, stable, weed-free organic matter source, derived from agricultural food, or industrial residuals’ biosolids (treated sewage sludge); yard trimmings, or source-separated or mixed solid waste as a component for seed establishment. The product shall contain no substances toxic to plants and shall be reasonably free (less than 1 percent by dry weight) of man-made foreign matter. Compost shall possess no objectionable odors and shall not resemble the raw material from which it was derived.

C. Compost shall have the following characteristics:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>PH Range</td>
<td>5.5 – 8.0</td>
</tr>
<tr>
<td>Moisture Content</td>

</tr>
<tr>
<td>Particle Size</td>
<td>Pass through 1-inch screen or smaller</td>
</tr>
<tr>
<td>Stability</td>
<td>Stable to highly stable, providing nutrients for plant growth</td>
</tr>
<tr>
<td>Maturity/Growth Screening</td>
<td>Demonstrate ability to enhance plant growth</td>
</tr>
<tr>
<td>Soluble Salt Concentrations</td>
<td>2.5 dS (mmhos/cm) or less preferred</td>
</tr>
<tr>
<td>Organic Matter Content</td>
<td>30% - 70%</td>
</tr>
<tr>
<td>Suggested Source</td>
<td>A-1 Organic, Eaton, Colorado (970) 454-3492, “or-equal.” Submit Sample for approval.</td>
</tr>
</tbody>
</table>
D. Organic Compost Soil Amendment shall be well mixed with onsite soil at an applied rate of 1 cubic yard per 5 cubic yards.

E. Unless specified elsewhere, seed for buried riprap shall be with a mix of native grasses as proposed by a local, well qualified supplier. Rates and application will be as recommended by the supplier.

2.04 FILTER FABRIC

A. Use Mirafi 140 N nonwoven filter fabric or Engineer-approved equal in accordance with Section 31 32 16, Geotextile, where shown on Drawings.

2.05 CURING COMPOUND

A. Membrane-curing compound shall be in accordance with Section 03 39 00, Concrete Curing, or as specified below.

B. Membrane-curing compound shall be in accordance with ASTM C309. Membrane curing compound shall be sprayable, 18 percent minimum solids content, MasterKure 123, “or-equal” acceptable to Engineer. Membrane curing compound used on colored concrete shall be BASF Kure 1315, “or-equal” acceptable to Engineer. Curing compound must not cause discoloration of the boulder grout and boulders. When used on colored or stained boulder grout, curing compound shall be approved by color additive/stain manufacturer and compatible with the color additives, stains, and any surface treatments/finishes used.

2.06 UNDERDRAIN

A. See Section 33 46 00, Subsurface Drainage.

2.07 EROSION CONTROL BLANKET

A. Erosion control blanket shall be C125BN 100 percent.

2.08 SCULPTED ROCK (STAMPED/TEXTURED AND COLORED CONCRETE)

A. Sculpted rock per requirements of Section 03 45 39, Sculpted Concrete.

2.09 FAUX ROCK

A. Faux rock per requirements of Section 03 37 14, Faux Rock.
PART 3 EXECUTION

3.01 SUBGRADE PREPARATION

A. Water Control: Prior to commencing work on rock placement, install water control measures as required to perform work in dry conditions. Water control measures shall include, but are not limited to, diversions, sumps with pumps or other means necessary to maintain the level of groundwater below subgrade elevation and to divert surface water away from the work area. The Contractor is responsible for investigating and understanding all site conditions that may affect the work, including surface water, level of groundwater and time of year the work is to be done. By submitting a bid, the Contractor acknowledges that such investigations have been made and consideration of such conditions are a part of the Contractor’s bid.

B. Subgrade Preparation for Boulders: Excavate for placement of rock as indicated, providing a firm smooth uniform surface at the proper grade. The subgrade shall undisturbed native material unless shown in fill areas or as otherwise shown on Drawings. Excavation and subgrade shall at a minimum meet the requirements of Section 31 23 13, Subgrade Preparation, and Section 31 23 16, Excavation, or as otherwise specified below. In fill areas under nongrouted armoring or structures, the subgrade to be compacted to 95 percent maximum density (ASTM D698) or to 70 percent of its maximum relative density (ASTM D2049). In fill areas under or otherwise supporting grouted rock, sculpted concrete, faux rock, or structures, the subgrade shall meet the stricter requirements of Subgrade under Structures as specified in Section 31 23 13, Subgrade Preparation. In fill areas after removal of topsoil and any soft yielding material, place approved onsite material and compact as specified herein to the designated subgrade elevation. Subgrade elevation and compaction shall be verified by the Engineer prior to placement of riprap or boulders. Refer to Section 31 23 13, Subgrade Preparation, for removal and replacement of unsuitable material.

3.02 LOOSE BOULDER MAT PLACEMENT

A. Definition: Loose boulders shown on Drawings as rounded surface boulders that create a reinforcing/armoring mat in contact with the subgrade.

B. Prepare subgrade. Bedding shall be that indicated on the details of Drawings.

C. Boulders shall be individually placed in a manner to avoid displacing underlying materials. Each boulder shall be placed to the final position by the use of a multi-prong grapple device or suitable equipment for handling individual boulders. If necessary, the boulder shall be picked up and repositioned with minimal disturbance to the subgrade.
D. Boulders shall be set in contact with each other so that the interstices between adjacent boulders shall be as small as the character of the rock will permit.

E. Placement shall begin at the bottom of slope.

F. Moving boulders by drifting or manipulation down the slope will not be permitted. Boulders shall not be dropped from a height of greater than 1 foot.

G. Voids between boulders shall be filled with smaller rock by hand and machine as directed by the Engineer.

H. Arrange each boulder as directed by Engineer. In general, loose boulders in contact with the subgrade will be arranged with a flat surface upward and horizontal. It should be anticipated that rehandling of individual stones after initial placement will be required to achieve required slopes, grades, elevations, aesthetics, and position.

I. Control Areas Tolerance: Elevations of top of boulders in control areas shall be within plus or minus 1-inch of design grade and design elevations on average as shown on Drawings as determined by the Engineer. Evaluation shall be completed by averaging the finished surface elevations of boulders above and below the design surface elevations for the cross-section (cut nominally perpendicular to flow or centerline) of any bank or feature over a width of approximately 3x the minimal boulder diameter. The Engineer shall use visual inspection, survey or other measurement techniques for evaluation of tolerances of control areas. Control areas include, but are not limited to, any areas identified on the Drawings or by Engineer as control areas, crests of drop structures, water control structures, tuning areas, wall caps, boat chutes, areas adjacent to boat chutes and areas adjacent to whitewater features. Prior to placing boulders with dimensions that exceed the minimum specified, excavate the subgrade as required to achieve top surface.

J. Non-Control Areas Tolerance: Non-control areas of boulders are any area not defined as a control area by the Specifications or Drawings. Elevations of top of boulders in non-control areas shall be within plus or minus 3 inches of design grade and design elevations on average as shown on Drawings as determined by the Engineer. Evaluation shall be completed by averaging the finished surface elevations of boulders above and below the design surface elevations for the cross-section (cut nominally perpendicular to flow or centerline) of any bank or feature over a width of approximately 3x the minimal boulder diameter. The Engineer shall use visual inspection, survey or other measurement techniques for evaluation of tolerances of non-control areas. Prior to placing boulders with dimensions that exceed the minimum specified, excavate the subgrade as required to achieve top surface.
K. Place soil or cobble between all individual boulders of the loose boulder mat to a height of 3/4 of the diameter of the boulders unless otherwise shown on Drawings.

3.03 ALL BOULDERS AND ROCK TO BE GROUTED

A. See requirements in Section 2 above.

B. Grouted rock (core rock, feature boulders, and surface boulders) installation shall be subject to approval by the Engineer at two stages:

1. Following subgrade preparation and before placement of any rock; and,
2. Before grouting the placed rock.

C. The Engineer shall be notified a minimum of 48 hours before the schedule placement of any rock for grouted rock installation to allow inspection of prepared subgrade. The prepared subgrade shall be subject to approval by the Engineer and no rock shall be placed without such approval.

D. The Engineer shall be notified a minimum of 48 hours before the scheduled placement of any boulder grout for grouted rock installations. The arrangement, elevation and cleanliness of rock to be grouted shall be subject to approval by the Engineer and no boulder grout shall be placed prior to such approval.

E. Prepare subgrade. Placement methods will avoid displacing the compacted subgrade. Install fabric if/where shown on Drawings.

F. Boulders shall be set in contact with each other so that the interstices between adjacent boulders shall be as small as the character of the rock will permit.

G. Tolerances for boulder placement shall be as indicated on Drawings or specified herein. In some cases, it may be necessary to remove a boulder, adjust the subgrade elevation and reset the boulder to achieve the required surface tolerance.

3.04 FEATURE BOULDERS AND SURFACE BOULDERS TO BE GROUTED (ADDITIONAL REQUIREMENTS)

A. Prepare subgrade (see Article Subgrade Preparation above).

B. Boulders shall be individually placed in a manner to avoid displacing underlying materials. Each boulder shall be placed to the final position by the use of a multi-prong grapple device or suitable equipment for handling individual boulders. If necessary, the boulder shall be picked up and repositioned with minimal disturbance to the subgrade.
C. Placement shall begin at the bottom of slope.

D. Moving boulders by drifted or manipulation down the slope will not be permitted. Boulders shall not be dropped from a height of greater than 1 foot.

E. Arrange each boulder as directed by Engineer. In general boulders will be arranged with a flat surface upward and horizontal. It should be anticipated that rehandling of individual stones after initial placement will be required to achieve required slopes, grades, elevations, and position.

F. Where boulders are stacked and not interlocked behind boulders on the down slope, pinning of the boulders may be allowable as approved by the Engineer. Refer to the Drawings for additional information regarding pinning of boulders.

G. Control Areas Tolerance: Elevations of top of boulders in control areas shall be within plus or minus 1-inch of design grade and design elevations on average as shown on Drawings as determined by the Engineer. Evaluation shall be completed by averaging the finished surface elevations of boulders above and below the design surface elevations for the cross-section (cut nominally perpendicular to flow or centerline) of any bank or feature over a width of approximately 3x the minimal boulder diameter. The Engineer shall use visual inspection, survey or other measurement techniques for evaluation of tolerances of control areas. Control areas include, but are not limited to, any areas identified on the Drawings or by Engineer as control areas, crests of drop structures, water control structures, tuning areas, wall caps, boat chutes, areas adjacent to boat chutes and areas adjacent to whitewater features. Prior to placing boulders with dimensions that exceed the minimum specified, excavate the subgrade as required to achieve top surface.

H. Non-Control Areas Tolerance: Non-control areas of boulders are any area not defined as a control area by the Specifications or Drawings. Elevations of top of boulders in non-control areas shall be within plus or minus 3 inches of design grade and design elevations on average as shown on Drawings as determined by the Engineer. Evaluation shall be completed by averaging the finished surface elevations of boulders above and below the design surface elevations for the cross-section (cut nominally perpendicular to flow or centerline) of any bank or feature over a width of approximately 3x the minimal boulder diameter. The Engineer shall use visual inspection, survey or other measurement techniques for evaluation of tolerances of non-control areas. Prior to placing boulders with dimensions that exceed the minimum specified, excavate the subgrade as required to achieve top surface.
3.05 FEATURE BOULDER INSTALLATION (ADDITIONAL REQUIREMENTS)

A. Feature boulders shall be set in locations shown on Drawings and as directed by the Engineer or Inspector in the field.

B. Stake locations of boulders for review prior to setting boulders.

C. Engineer or Inspector will hand select each feature boulders at source.

D. Contractor shall rotate boulder as directed by the Engineer and measure limit of height, width and length. It should be anticipated that rehandling and moving of individual boulders after initial placement will be required to achieve the required slopes, grades, and positions.

E. The finished elevation of feature boulders shall be within plus or minus 4 inches of the elevations shown on Drawings, unless otherwise authorized by the Engineer or Inspector in the field.

3.06 BOULDER GROUT PLACEMENT

A. Boulder grout placement shall meet all applicable requirements of Section 03 30 00, Cast-in-Place Concrete, Section 03 30 00, Cast-in-Place Concrete, and in Section 2 above. See notification requirements above.

B. Unless otherwise shown on Drawings, slump shall be adjusted onsite as specified in Section 2 above for single layer and multiple layer grouting. The use of stiffer mixes or other measures may be approved for individual or partial truck loads by the Engineer for steeper slope applications.

C. Maintain water control measures before, during and after boulder grout placement until sufficient cure is obtained. Care shall be taken to remove all fines and smaller rock. Wash the rock free of fines or soil which would affect the bond. Any loose material between rocks shall be removed to ensure complete grout penetration down to compacted subgrade and in all voids between rocks.

D. All boulders shall be wetted prior to boulder grout placement for proper bonding. Excess water or ponding on the subgrade shall be removed prior to boulder grout placement.
E. The boulder grout shall be injected into the voids by pumping under low pressure, through a 3-inch maximum diameter hose to ensure complete penetration of the boulder grout to the subgrade. The voids at the surface, as detailed on Drawings, will not be grouted unless designated. Operator shall be able to stop the flow and will place boulder grout in the voids and not on the surface of the rock. Clean and wash any spillage before the boulder grout sets. The visual surfaces of the rock will be free of boulder grout to provide a clean natural appearance. A “pencil” vibrator will be used to make sure all voids are filled between and under rock. The intent is to fill all voids with boulder grout from the subgrade level through the rock layer. In all cases, boulder grout must penetrate to subgrade. The pencil vibrator may be used to smooth the appearance of the surface, but the Contractor shall use a wood or steel float and/or trowel to smooth and grade the boulder grout surface to drain. Final surface shall be broomed or textured for a slip-resistant finish.

F. Boulder grout shall be cured as specified in Section 03 30 00, Cast-in-Place Concrete and Section 03 39 00, Concrete Curing. If curing compound is allowed, it shall not be sprayed into or washed off in the river. The curing compound shall dry for 24 hours minimum before allowing water to flow over it. In cold weather conditions, the entire grouted rock mass shall be protected from freezing as outlined in Section 03 30 00, Cast-in-Place Concrete.

G. Provisions for Grouting Multiple Boulder Layers: Multiple layers of boulders having boulder grout depths up to 6 feet thick shall be grouted in a single operation in order to form a single monolithic structure.

1. Where the boulder grout depth is greater than 6 feet thick, grouting shall be completed in multiple lifts less than 6 feet unless otherwise approved by the Engineer. The initial layer(s) of rock to be grouted shall be placed and then grouted with the boulder grout held a minimum of 6 inches and not more than 50 percent of the rock diameter below the top of the rock. Boulder grout placed for the subsequent layer will then penetrate down and around the tops of the first layer maximizing the strength of the joint. Successive layers of rock shall not be placed on top of grouted boulders until the boulder grout has cured at least 7 days or until the boulder grout reaches 80 percent of the design strength required by these Specifications.

H. Boulder Grout Coloring, Surface Treatments, and Staining:

1. Integral Color:
   a. Integral colored boulder grout shall meet the following finishing requirements:
      1) Do not dampen finishing tools.
      2) Do not over-trowel or start troweling late.
3) Finishing per the approved sample panel.

2. Dry Shake Color Hardeners: Apply per manufacturer recommendations and approved sample panel installation.

3. Surface Stains:
   a. Staining of Boulder Grout shall meet the following requirements:
      1) Application of stains shall be per manufacturer recommendations and the approved sample panel.
      2) Stain shall be applied once the Boulder Grout has cured 28 days.
      3) A sealant shall be applied per manufacturer’s recommendations that is compatible with the stain used.

3.07 SOIL PLACEMENT IN AND OVER ROCK

A. Where rock is designated to be buried or voids partially filled, place onsite excavated material that is free from trash and organic matter in voids by washing and rodding. When voids are filled and the surface accepted by the Engineer. Fine grade per Section 31 23 23, Fill and Backfill.

3.08 SCULPTED ROCK

A. Methods of construction shall be per Section 03 45 39, Sculpted Concrete.

3.09 FAUX ROCK

A. Methods of construction shall be per Section 03 37 14, Faux Rock.

END OF SECTION
SECTION 31 41 00
SHORING

PART 1 GENERAL

1.01 SUBMITTALS

A. Informational Submittals:
   1. Excavation support plan.
   3. Trench excavation plan.
   4. Movement measurement and data and reduced results indicating movement trends.

1.02 QUALITY ASSURANCE

A. Provide surveys to monitor movements of critical facilities.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Design, provide, and maintain shoring, sheeting, and bracing as necessary to support the sides of excavations and to prevent detrimental settlement and lateral movement of existing facilities, adjacent property, and completed Work.

3.02 EXCAVATION SUPPORT PLAN

A. Prepare excavation support plan addressing following topics:

   1. Details of shoring, bracing, sloping, or other provisions for worker protection from hazards of caving ground.
   2. Design assumptions and calculations.
   3. Methods and sequencing of installing excavation support.
   4. Proposed locations of stockpiled excavated material.
   5. Minimum lateral distance from the crest of slopes for vehicles and stockpiled excavated materials.
   6. Anticipated difficulties and proposed resolutions.
3.03 MOVEMENT MONITORING PLAN

A. Prepare movement monitoring plan addressing following topics:
   1. Survey control.
   2. Location of monitoring points.
   3. Plots of data trends.
   4. Interval between surveys.

3.04 REMOVAL OF EXCAVATION SUPPORT

A. Remove excavation support in a manner that will maintain support as excavation is backfilled.
B. Do not begin to remove excavation support until support can be removed without damage to existing facilities, completed Work, or adjacent property.
C. Remove excavation support in a manner that does not leave voids in the backfill.

3.05 TRENCHES

A. For trench excavation exceeding 5 feet in depth, provide adequate safety system meeting requirements of applicable state and local construction safety orders, and federal requirements.

END OF SECTION
ZINK DAM IMPROVEMENTS

SECTION 31 68 13
PRESTRESSED ROCK ANCHORS

PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   d. A416, Standard Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete.
   e. A615, Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
   f. A653, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   g. A882, Standard Specification for Epoxy-Coated Seven-Wire Prestressing Steel Strand.
   m. C309, Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.
   o. C942, Standard Test Method for Compressive Strength of Grouts for Preplaced-Aggregate Concrete in the Laboratory.
r. D95, Standard Test Method for Water in Petroleum Products and 
Bituminous Materials by Distillation.
t. D566, Standard Test Method for Dropping Point of Lubricating 
Grease.
u. D610, Standard Test Method for Evaluating Degree of Rusting on 
Painted Steel Surfaces.
w. D3350, Standard Specification for Polyethylene Plastics Pipe and 
Fittings Materials.
x. D4101, Standard Specification for Propylene Plastic Injection and 
Extrusion Materials.
y. D4289, Standard Test Method for Elastomer Compatibility of 
Lubricating Greases and Fluids.
z. D4327, Standard Test Method for Anions in Water by Chemically 
Suppressed Ion Chromatography.

1.02 ALTERNATE SYSTEMS
A. Other types of post-tensioning systems complying with Drawings and 
Specifications will be considered as an alternate to basic system shown and 
specified.
B. Provide details of construction methods, materials, and design calculations.
C. Alternate system(s) will be subject to Engineer’s review and approval.

1.03 DEFINITIONS
A. Alignment Load: Nominal load maintained in anchor to keep testing 
equipment positioned.
B. Anchor: System used to transfer tensile loads to concrete or rock. Includes 
prestressing steel, anchorages, grout, coatings, sheathings, provisions for 
sounding the top of the primary grout, provisions for installing grout and 
venting air, and couplers if used.
C. Anchor Load: Load to which the anchor is stressed.
D. Centralizers: Spacers used to position tendon in center of anchor hole and to 
space the individual tendons in a particular pattern to ensure uniform grout 
cover for tendon.
E. Consolidation Grout: Portland cement grout that is injected into the hole prior 
to inserting tendon to seal or stabilize hole.
F. Creep Movement: Total movement that occurs during creep test of anchor.

G. Creep Test: Test to determine movement of tendon at constant load during certain time period.

H. Design Load: Anticipated final maximum effective load in anchor after allowance for time-dependent losses.

I. Double Corrosion Protection: Protection of tendons wherein the first layer of protection is provided by primary grout or secondary grout, and the second layer is as specified in this section.

J. Elastic Movement: Recoverable movement of anchor measured during performance test.

K. Leveling Grout: Nonshrink grout used for bedding and leveling tendon anchorage bearing plate.

L. Lift-Off Test: Checking force in prestressed anchor at any specified time with use of hydraulic jack.

M. Performance Test: Incremental test loading and unloading of tendon anchorage recording of movement of tendon at each increment.

N. Primary Grout (or Anchor Grout): Grout that is injected into anchor hole to provide anchorage of tendon prior to stressing.

O. Primary Grout Zone: That section of the anchor that is grouted before stressing.

P. Proof Load: Temporary prestressing load in anchor at force level greater than its design load for testing purposes.

Q. Proof Test: Incremental test loading of tendon anchorage, recording of tendon movement at each load increment.

R. Redrilling: Removal of consolidation grout from a tendon hole.

S. Residual Movement: Nonelastic (nonrecoverable) movement of anchor measured during performance test.

T. Secondary Grout: Grout that is injected into anchor hole after stressing to cover length of prestressed anchor above the primary grout, providing corrosion protection for high strength steel.

U. Secondary Grout Zone: That section of the anchor that is stressed before grouting.
V. Set Time: Time between start of mixing grout and liquid phase changing into plastic state.

W. Sheathing: Enclosure around the prestressing steel to avoid bonding between the surrounding grout or to provide corrosion protection.

X. Sounding: A method used by the Contractor to lower a rigid wire, bar, or pipe through a hole in the stressing head to physically touch the top of the primary grout and determine the actual elevation for comparison with the maximum elevation permitted.

Y. Tendon: Complete anchor assembly (excluding grout) consisting of stressing anchorage and high strength prestressing steel, with sheathing and coating when required.

Z. Tendon Manufacturer: Company supplying the high strength steel or bars.

AA. Test Load: Temporary prestressing load in anchor at force level equal to 1.33 times design load.

BB. Topping Grout: Nonshrink grout used to fill in stressing anchorage blockout after secondary grouting is completed and excess tendon lengths are cut off.

CC. Transfer (Lockoff) Load: Post-tensioning force (Kips) per anchor transferred to the anchor plate when the lockoff devices are set and jack load is released.

DD. Water Test: Testing of a drilled hole using water to determine watertightness of the hole.

1.04 SUBMITTALS

A. Action Submittals:

1. Manufacturer’s Product Data:
   a. Prestressed Anchors: Material specification, load capacities, and installation procedures.
   c. Sheathing: Corrugated or extruded, if specified.
   d. Leveling and topping nonshrink grout.
   e. Admixtures.

2. Post-Tension System:
   a. Tendon Design, Details, and Calculations: Include size, number, and type of tensioning elements, anchorages, bearing plates, pipe sleeves, other related hardware, fabrication and erection details.
   b. Proposed method to provide the extruded polypropylene sheath a watertight seal with the base of the anchor head.
c. Structural and Stressing Calculations: Include allowances for increase in stressing length resulting from development of tendon anchorage at the top of the primary grout and time-dependent loss of load values.

d. Top Anchorage and Bearing Plates: Design and details. Show incorporation of specified functions.

e. Grout and Vent Tube: Arrangement details.

f. Tendon Anchorages: Detailed stressing procedures and data required for performance testing and proof testing.

3. Special Reinforcing Steel: Confirmation that details at tendon anchorages shown are adequate, or suggested specialized reinforcing.

B. Informational Submittals:

1. Schedule showing sequence of grouting operation.

2. Qualifications:
   a. Installer’s experience records.
   b. System designer.
   c. Testing laboratory.

3. Post-Tension System:
   a. Installation instructions.
   b. Certification of conformance.
   c. Onsite storage instructions.

   a. Steel Manufacturer’s Mill Certification:
      1) Physical and chemical properties including stress-strain curves, steel area, guaranteed ultimate tensile strength, yield strength, elongation at yield, and estimated values for relaxation characteristics of steel.
      2) Include one report per run and identify system, showing disposition of materials onsite.

5. Steel Reinforcement: Manufacturer’s test data.

6. Grouts: Mix design, trial batch test results, and field test reports.

7. Grout Admixtures: Manufacturer’s mixing and installation instructions.

8. Certification that grouts and admixtures do not contain chlorides, aluminum powder, or other corrosive elements for the prestressing.

9. Installation Details: Grout pipe and primary grout arrangement, sounding procedures, and grout pumping.

13. Anchor hole record data.

14. Grouting record data.
15. Submit record document tensioning, testing, and lift-off data applicable to tendon, including plot of performance tests showing total anchor movement as a function of load and a plot of residual movement as a function of load.

1.05 QUALIFICATIONS

A. Installer: Minimum of 5 years’ acceptable experience involving type of post-tensioning system. Available onsite, full-time, during entire drilling, grouting, and prestressing operations.

B. System Design and Shop Drawing Preparation: Performed by a professional civil or structural engineer currently registered in the state of Oklahoma who will stamp and sign Shop Drawings.

C. Testing Laboratory: Independent, certified to perform grout cube strength testing in accordance with ASTM C942.

1.06 RECORD DOCUMENTS

A. Anchor Hole Record Data:

1. Record the following:
   a. Elevation of concrete-rock interface during anchor hole drilling.
   b. Hole deviation from design orientation, direction of deviation, and the amount.
   c. Anchor hole water testing, consolidation grouting, and redrilling.
   d. Tendon installation.
   e. Grout strength testing, fluidity tests, set time tests, as specified for each type of grout.
   f. Primary tendon grouting, tensioning, and tendon testing with plots of anchor movement as a function of load.
   g. Sounding measurements and elevation of top of primary grout.
   h. Secondary tendon grouting.
   i. Lift-off data.

B. Grouting Operation Data: Record for each tendon installed.

1. Type of mixer.
2. Amount of water added per bag.
3. Grout pressure.
4. Strength test cube sample designations.
5. Test results showing specific gravity, flow cone test, mud balance, and bleed test data.
6. Volume of primary grout placed.
7. Elevation at top of primary grout measured.
8. Time and date.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Protect uncoated or otherwise unprotected tendon components with vapor-phase corrosion inhibitors and wrap or cover at factory to prevent damage and to prevent dirt, water, and rust from affecting components during shipping storage and up until time of installation.

B. Materials showing rust sufficient to cause excessive surface roughness, pitting visible to naked eye, or unevenness will be considered defective and will be rejected.

PART 2 PRODUCTS

2.01 SYSTEM DESIGN

A. Design: Meet requirements of 2014 Edition of “Recommendations for Prestressed Rock and Soil Anchors” in Post-Tensioning Manual published by Post-Tensioning Institute (PTI), except requirements of these Specifications and Drawings will take precedence over PTI publication.

B. Design anchorage and blockout requirements.

C. Size tendon holes when required size exceeds minimum shown or specified.

D. Detail tendon anchor lengths subject to requirements shown.

E. Provide centralizers to center tendons in holes.

F. Special Reinforcing Steel: Design at tendon anchorages as necessary. Verify size and arrangement of local zone and general zone reinforcing within concrete member to resist spalling and splitting tensile stresses in concrete due to tensioning forces.

G. Performance Specification:

1. Maximum Tendon Stress: 80 percent of Guaranteed Ultimate Tensile Strength (GUTS).

2. Tendon Transfer (Lockoff) Load: Not to exceed 70 percent of GUTS.

3. Minimum requirements for each tendon at design load level, and with maximum allowable tendon hole bond stress allowable at any load level, as shown.

4. Design Load: Not to exceed 60 percent of GUTS after losses.

2.02 REINFORCING STEEL

A. Steel Reinforcement:

1. Conform to ASTM A615, Grade 60.

2. Bar Splices: Capable of developing 125 percent of bar yield strength.

2.03 PRESTRESSED ANCHOR TENDONS

A. Provide complete assembly including prestressing steel, grouted fixed anchorage, and stressing anchorage.
B. Steel Thread Bars:

1. Deformations of Thread Bars:
   a. Form screw thread suitable for mechanically coupling lengths of thread bar and for positive attachment of anchor assemblies.
   b. Meet ASTM A722 requirements and be uniform such that any length of bar may be cut at any point and internal threads of a coupling designated for that size of bar can be freely screwed on bar.

2. Tensile and Physical Properties:
   a. Nominal Diameter: As shown.
   b. Ultimate Tensile Stress: Minimum 150,000 psi.
   c. Yield Stress at 0.2 Percent Offset: Minimum 120,400 psi.
   d. Elongation in 10-Bar Diameter: Minimum 7 percent.
   e. Carbon Content: Maximum 0.55 percent.
   f. Sacrificial metal coatings shall not be applied to the prestressing steel, but may be used for bearing plates and/or trumpets.

3. Thread bars with quenched or tempered steels are not permitted.

4. Provide products from manufacturers with minimum 5 years’ experience, under their current name, in manufacturing of post-tensioning material.

5. Bars and their deformations shall be hot-rolled.

6. Manufacture to meet requirements of ASTM A722, including supplementary requirements of ASTM A722. When testing in accordance with ASTM A722, provide minimum of four Samples from material from each heat and test two samples in tension and two Samples in bend test.

7. Components: Provide couplers, nuts, bearing plates, and other system components as required for complete installation.

8. Manufacturers and Products:
   a. Use materials from single manufacturer.
   b. Dywidag Systems International, USA, Inc., Lincoln Park, NJ; Dywidag Prestressed Thread Bar Tendon System, or Williams Form Hardware and Rockbolt Ltd. Belmont, MI; Grout Bonded (Multiple Corrosion Protected) Rock and Soil Anchor Systems.

C. Top Anchorage and Bearing Plates:

1. Design and fabricate of steel to dimensions sufficient to prevent permanent physical distortion when tested with tendon of size required.

2. Bearing Plate:

4. Couplers for Bars:
   a. Screw-on type as furnished by bar manufacturer.
   b. Capable of developing specified guaranteed minimum tensile strength of bars without evidence of failure.

5. Design anchorages to develop at least 95 percent of actual ultimate strength of tendon, tested in an unbonded state, without exceeding anticipated set.

6. Design anchorage to allow verification of prestress force in tendon prior to removal of stressing equipment.

D. Splices in Bar Tendons: As approved by Engineer in accordance with Article Submittals.

E. Centralizers: As required to ensure that specified clearance between tendon and grout hole is maintained.

F. Post-Tensioning Units: Do not weld; perform any necessary welding in vicinity of tendons or tendon materials with extreme caution to avoid touching tendon with electrode and to avoid electrical circuits that may cause resistance heating of tendon.

G. Grout and Vent Tubes:
   1. Designed by tendon manufacturer for coordination with holes required in baseplate and proper grouting procedures.
   2. Coordinate with methods for sounding top elevation of primary grout.
   3. Make provision to remove and dispose of water from bottom of hole if present.
   4. Verify drill hole size to receive anchor and, if this hole size is required to be of larger diameter than that shown to allow placement of tubes, grout, and sounding devices, show larger diameter on Shop Drawings.
   5. Provide a minimum of 1/2-inch diameter tube at centerline of tendon to be used to sound top of primary grout using a positive rigid or semi-rigid measuring rod to extend down to top of grout.
   6. Sounding Device: Positive rigid measuring rod or wire.
2.04 PORTLAND CEMENT
   A. ASTM C150, Type II.
   B. Fresh, without lumps or other indication of hydration or “pack set.”

2.05 WATER
   A. Clean and meeting Federal and State Drinking Water Standards with regard to oil, acid, alkali, organic matter, and injurious quantities of chlorides, fluorides, sulphites, and nitrates.

2.06 SAND
   A. Fine aggregate for concrete as specified by ASTM C33.
   B. Not more than 4 percent passing U.S. Standard No. 200 sieve when tested in accordance with ASTM C117.

2.07 GRANULAR FILLER
   A. Size: As designated by Engineer in field.
   B. Gradation: Meeting requirements of ASTM C33.

2.08 LEVELING AND TOPPING GROUT MIX
   A. Nonmetallic, nongas liberating, fluid, prepackaged nonshrink grout with natural aggregate.
   B. Meet requirements of Corps of Engineers’ Specification for Non-Shrink Grout, CRD-C621, and ASTM C1107, Grade B.
   C. Fluid Grout: Fluid consistency (20 to 30 seconds), as determined by flow cone test, CRD-C611 or ASTM C939.
   D. Strength: Minimum cube strength of 2,500 psi at 1 day and 7,000 psi at 28 days as determined by CRD-C621 or ASTM C942.
   E. Manufacturers and Products:
      1. Master Builders, Cleveland, OH; Master Flow 928.
      2. Euclid Chemical Co., Cleveland, OH; Hi-Flow Grout.
2.09 WATER REDUCING PLASTICIZER ADMIXTURES
A. Manufacturers and Products:

2.10 CURING COMPOUND
A. ASTM C309.
B. Moisture Loss: Not to exceed 0.030 gram per square centimeter per 72 hours.
C. Manufacturers and Products:
   1. Masters Builders, Cleveland, OH; Masterkure.
   2. Euclid Chemical Co., Cleveland, OH; Euco Super Floor Coat.

2.11 CONSOLIDATION GROUT MIX
A. Composition: Portland cement, Type II, sand and water.
B. Minimum Compressive Strength: 3,500 psi at 14 days.
C. Water-Cement Ratio: Determined by Contractor.
D. Water Loss: Control by use of granular filler as required by Engineer.

2.12 GROUT FOR PRIMARY AND SECONDARY GROUTING OF SINGLE BAR UNITS
A. Fluid, prepackaged, nonshrink grout requiring only addition of water.
B. Extended working time, fluid for at least 1 hour with fluid consistency of 20 seconds to 30 seconds per flow cone test of CRD-C611.
C. Pumpable nonshrink, nonmetallic, nonbleeding, and nongas forming.
D. Provide certification grout contains no chlorides or other elements corrosive to prestressing steel.
E. Strength: Minimum cube strength of 2,500 psi at 1 day and 7,000 psi at 28 days when sampled and tested per ASTM C942.
F. Manufacturers and Products:
   1. Master Builders Co., Cleveland, OH; Master Flow 928.
2. Euclid Chemical Co., Cleveland, OH; Hi-Flow Grout.

2.13 DOUBLE CORROSION PROTECTED POST TENSIONING SYSTEM

A. First Layer of Protection: Primary or secondary grout.

B. Second Layer of Protection:

1. Primary Grout Zone: Centralized bare prestressing steel bar in primary and secondary grout zones and encapsulated in grout inside a corrugated polypropylene or polyethylene sheath. Sheath extended the full length of hole and covered with grout.
2. Top anchorage will be embedded in concrete.

C. Corrugated Sheathing:

1. Wall Thickness: Sufficient to protect against corrosion, prevent movement during tendon stressing, and to transfer the stress to the rock. Either polypropylene or polyethylene, at Contractor’s option.
2. Polypropylene: Designation Type PP210B5554211, ASTM D4101.
   a. Manufacturer and Model: Ashland Chemical Co.; PROFAX 6823 and 7823.

D. Corrosion Inhibitor:

1. Drop Point: 300 degrees F minimum, ASTM D566.
2. Flash Point: 300 degrees F minimum, ASTM D92.
3. Water Content: 0.1 percent maximum, ASTM D95, E1.
4. Oil Separation: 0.5 percent by weight maximum at 160 degrees F, FTMS 791B, Method 321.2.
5. Corrosion Test: 5 percent salt fog at 100 degrees F, 5 mils (Q panel Type S); normal conditions, rust Grade 7 or better after 720 hours; aggressive conditions, rust Grade 7 or better after 1,000 hours; ASTM B117 and ASTM D610, E1.
6. Soak Test: 5 percent salt fog at 100 degrees F, 5 mils (Q panel Type S), immerse panels in 50 percent salt solution and expose to 5 percent salt fog, no emulsification after 720 hours; ASTM B117.
7. Water Soluble Ions:
   b. Nitrates: 10 ppm maximum, ASTM D4327.
   c. Sulfides: 10 ppm maximum, APHA 427D (15th Ed.).
8. Sheathing Hardness and Volume Change: 10 percent maximum for volume, 15 percent maximum for hardness after 40 days at 150 degrees F, ASTM D4289.
9. Sheathing Tensile Strength Change: 30 percent maximum after 40 days at 150 degrees F, ASTM D638.

2.14 SOURCE QUALITY CONTROL

A. Performed by independent testing laboratory.

B. Grout Mixes: Mix a trail batch of proposed grout mix design and test grout strength using 2-inch cubes cured and tested per ASTM C942.

1. Trial Batch: Use actual cement and actual water that will be used at Site. Test cubes 28 days and proposed cure primary grout prior to scheduled tensioning of tendons.

PART 3 EXECUTION

3.01 DRILLING EQUIPMENT

A. Coring, rotary drilling, or percussion hammer type.

3.02 GROUTING EQUIPMENT

A. Continuous operation without interruption.

B. Mixer: High speed colloidal type mixer with a water meter for precise control. Provide dispensers with accurate controls for all admixtures.

C. Pumps: Progressive cavity type, capable of pumping grout as required to match working time of grout.

1. Measure pumped grout quantity within 0.1 cubic foot.
2. Pressure: 150 psi at top of hole.

D. Screen:

1. Clear Openings: 0.125-inch maximum size.
2. Easily accessible for inspection and cleaning.

E. Testing Equipment: Provide flow cone (for checking fluidity), containers (to check bleeding of grout), and cube molds (for sampling, clamping, and sealing of cube samples). Provide a mud balance (for maintaining the correct specific gravity and admixture and water-cement ratio).

1. Dog Leg: A steel mandrel, 10 feet long and 1 inch smaller in diameter than anchor hole (for checking diameter and straightness of drilled hole).
3.03 TENDON TENSIONING EQUIPMENT

A. Hydraulic Jacks:
   1. Pressure Gauge:
      a. Reading Dial: At least 6 inches in diameter and accurate enough to read 100 psi changes in gauge pressure.
      b. Calibrated as unit with jack cylinder extension in approximate position for final jacking force within three weeks prior to stressing.
   2. Capable of applying each load increment in less than 60 seconds.

B. Incremental Measuring Devices: Capable of detecting tendon movement to nearest 0.001 inch.

3.04 DRILLING

A. Follow approved procedures.

B. General:
   1. Coring, rotary drilling, or percussion-air-hammer type drilling.
   2. Use water or air with sufficient moisture for dust control to remove drill cuttings.
   3. Do not use rod dope, grease, or other lubricants during drilling.
   4. Do not cause permanent structural damage to existing concrete sections.
   5. If permanent damage occurs, discontinue method of drilling and substitute another method at no additional cost.
   6. Repair structural damage by approved method.

C. Drill holes with appropriate size bit or core with diameter of bit or core not less than 1/8-inch smaller than designed or specified hole diameter.

D. Consolidation Grouting and Redrilling: Perform when watertightness test fails as specified hereinafter.

E. After completion of drilling, wash sides of holes with a nozzle that will impinge water on sides of hole.

F. During washing, provide water velocities in hole sufficient to remove loose material from hole.

G. If a hole is rejected by Engineer, due to failure to maintain required alignment or due to any fault or negligence of Contractor, fill hole with consolidation grout. Drill new hole in location determined by Engineer.
H. Test holes drilled for installation of tendons for watertightness as specified hereinafter.

I. Drilled Holes: After acceptance of hole, close each hole with a tapered, turned wooden plug to prevent entry of unwanted grout, dirt, or other deleterious substance prior to installation of assemblies and grouting.

J. Anchor Hole Tolerances:
   1. Depth: Within minus 0 inch to plus 6 inches.
   2. Location: Within 1-1/2 hole diameters from planned location.
   3. Verticality: Within 1-degree of vertical.

3.05 CONSOLIDATION GROUTING

A. Maximum 5 psi gauge measured at hole top.

B. Maintain pressure on grout until initial set.

C. Initial Setting Time: Minimum 8 hours prior to redrilling.

3.06 TENDON INSTALLATION AND PRIMARY GROUTING

A. Preparation: Immediately prior to tendon installation, flush hole with water to provide saturated rock and concrete surfaces, remove standing water in bottom of hole, and sound hole for compliance with required depth.

B. Tendons:
   1. Free of dirt, loose rust, grease, or other deleterious substances.
   2. Place in accordance with approved Shop Drawings.
   3. Provide with rigid and adequate support during placement of primary grout.
   4. Do not weld. Perform welding in vicinity of tendons or tendon materials with extreme caution to avoid touching tendon with electrode and to avoid electrical circuits that may cause resistance heating of tendon.

C. Primary Grout:
   1. Pump into bottom of hole through clean and leak-free grout pipes.
   2. Measure amount being pumped to avoid overfilling hole.
   3. Continuously sound the primary grout surface by positive measuring rod through the holes in tendon baseplate to verify that grout is at correct elevation and is not higher than shown or approved.
   4. Keep grout pipe below grout surface to avoid entrapping air.
D. If top elevation of primary grout exceeds specified elevation by 1 foot or more, perform following remedial action:

1. Remove tendon, flush hole, and redrill if necessary or remove grout to the required elevation.
2. Replace tendon with new tendon if damaged.

E. After primary and anchor plate leveling grout operation is complete, allow tendon to remain undisturbed until grout has cured for the time required to reach minimum specified strength, as determined by ASTM C942.

F. Tolerance: Minimum 0.50-inch grout cover for tendons.

3.07 TENDON STRESSING

A. Do not tension tendon before primary grout and anchor plate leveling grout have cured for minimum specified time and grout strength, required by design and as shown on approved Shop Drawings or in calculations, has been verified by testing laboratory when cured at appropriate temperatures.

B. Tension tendon by means of equipment required by tendon manufacturer.

C. Conduct so that tension being applied and elongation of prestressing steel may be measured at all times.

D. Monitor tensioning with incremental measuring devices.

E. Modify blockouts to access tendon bearing plate or a jack chair to allow physical checking of end anchorage at lift-off.

3.08 SECONDARY GROUTING

A. Successfully complete the following prior to starting tendon secondary grouting:

1. Tendon stressing.
2. Tendon performance test.
3. Tendon proof test.
4. Tendon approval by Engineer.

B. After acceptance of tendon by Engineer install secondary grout mix both inside and outside group sheath.

C. Grout Pipes: Keep below grout surface to avoid entrapping air.
3.09 CUTTING OF TENDON PROTRUSIONS

   A. Perform upon completion of anchor installation.
   
   B. Cut that portion of anchor tendon protruding beyond stressing anchorage in accordance with tendon manufacturer’s representative’s recommendations.

3.10 LEVELING AND TOPPING GROUTING

   A. Upon completion of anchorage blockout, fill blockout with leveling grout.
   
   B. Upon completion of tendon protrusion cutting, fill blockout for tendon anchorage to the surface with topping grout.
   
   C. Match surface of topping grout to surrounding surface and coat with curing compound.

3.11 FIELD QUALITY CONTROL

   A. Conduct in Engineer’s presence.
   
   B. Perform at least one set of specified tests during each grouting phase for each anchor hole.
   
   C. Watertightness Test:
      
      1. Fill drilled hole with water and subject water to a pressure of 5 psi (11.5 feet) in excess of the hydrostatic head as measured at top of hole.
      2. Maximum Leakage Rate: 0.001 gallon per inch diameter per foot depth of hole per minute. 10-minute minimum test duration.
      3. Consolidation grout holes failing leakage rate for the entire length of the hole and redrill.
      4. Retest and repeat process until acceptable leakage test.
      5. Adjacent Holes: Observe during test to detect inter-hole connections.
      6. Consolidation grout holes to seal inter-hole connections and retest.
   
   D. Sounding: Perform prior to tendon stressing and prior to final hardening of the grout.
   
   E. Grout Test: ASTM C942, use clamped and sealed molds. Perform strength tests, mud balance (specific gravity) tests, fluid (flow cone) tests, and bleed tests.
   
   F. Tendon Performance Test:
      
      1. Performance test one anchor out of 10 and spatially distributed across the project.
2. Incrementally load and unload anchor per performance test schedule.
3. At each increment, record gauge reading and movement of tendon to nearest 0.001 inch with respect to an independent fixed reference point.
4. Measure anchor load with pressure gauge calibrated with the jack.
5. $P =$ Design load for anchor; (not to exceed 60 percent of guaranteed ultimate strength of tendon).
6. $AL =$ Alignment load; refer to Shop Drawings.
7. Performance Test Schedule:
   a. $AL$
   b. $0.25 \ P$
   c. $AL$
   d. $0.25 \ P$
   e. $0.50 \ P$
   f. $AL$
   g. $0.25 \ P$
   h. $0.50 \ P$
   i. $0.75 \ P$
   j. $AL$
   k. $0.25 \ P$
   l. $0.50 \ P$
   m. $0.75 \ P$
   n. $1.00 \ P$
   o. $AL$
   p. $0.25 \ P$
   q. $0.50 \ P$
   r. $1.00 \ P$
   s. $1.20 \ P$
   t. $AL$
   u. $0.25 \ P$
   v. $0.50 \ P$
   w. $1.00 \ P$
   x. $1.20 \ P$
   y. $1.33 \ P$ test load (10-minute hold).
   z. $AL$
   aa. Adjust to lockoff load.
8. Transfer (Lockoff) Load: Not to exceed 70 percent of Guaranteed Ultimate Tensile Strength (GUTS) of tendon (refer to approved Shop Drawing for transfer load information).
9. Anchor tendon may be completely unloaded prior to lockoff, if circumstances warrant, as final stressing then does not require further movement readings.
10. Hold load at each increment, just long enough to obtain movement reading.
11. Except for reading of residual movement at $AL$, no movement readings need to be taken during unloading of anchor.
12. Test Load: Hold for 10 minutes.
13. Record total movements with respect to a fixed reference point at 1 minute, 2, 3, 4, 5, 6, and 10 minutes.
14. If total movement between 1 minute and 10 minutes exceeds 0.04-inch (1 mm), hold test load for an additional 50 minutes.
15. Record total movements at 15 minutes, 20, 25, 30, 45, and 60 minutes.
16. Repump hydraulic jacks used to test anchors as required to maintain pressure during the creep test.
17. Take lift-off reading after transferring load to end anchorage and prior to removing jack.
18. Lift-Off Load: Within 5 percent of desired transfer load.
19. If lift-off load is less than 95 percent of transfer load, reset end anchorage and make another lift-off reading.

G. Tendon Proof Test:

1. Perform on all anchors.
2. Incrementally load anchor per proof test schedule below.
3. At each increment, record movement of tendon to nearest 0.001 inch (0.0025 cm) with respect to an independent fixed reference point.
4. Measure anchor load with pressure gauge calibrated with jack.
5. \( P = \) Design load for anchor shall not exceed 60 percent of guaranteed ultimate strength of tendon; see anchor schedule on Drawings.
6. \( AL = \) Alignment load (use monojack to set each strand).
7. Proof Test Schedule:
   a. \( AL \)
   b. \( 0.25 P \)
   c. \( 0.50 P \)
   d. \( 0.75 P \)
   e. \( 1.00 P \)
   f. \( 1.20 P \)
   g. \( 1.33 P \) test load (10-minute hold).
   h. \( AL \)
   i. Adjust to lockoff load.
8. Anchor tendon may be completely unloaded prior to lockoff, if circumstances warrant and final stressing will then not require further movement readings.
9. Transfer (Lockoff) Load: Not to exceed 70 percent of the GUTS; refer to approved Shop Drawing for transfer load information.
10. Hold load at each increment just long enough to obtain movement reading, but not more than 1 minute.
11. Test Load: Hold for 10 minutes.
12. Record total movements with respect to a fixed reference point at 1 minute, 2, 3, 4, 5, 6, and 10 minutes.
13. If movement between 1 minute and 10 minutes exceeds 0.04-inch (1 mm), maintain test load for 50 minutes or more.
14. Record additional anchor movements at 15 minutes, 20, 25, 30, 45, and 60 minutes.
15. Repump hydraulic jacks used to test anchors as required to maintain pressure during the creep test.
16. Compare proof test results to performance test results.
17. After transferring load to end anchorage and prior to removing jack, make a lift-off reading.
18. Lift-Off Load: Within 5 percent of the desired transfer load.
19. If lift-off load is less than 95 percent of transfer load, reset end anchorage and make another lift-off reading.

H. Anchor Acceptance Criteria:

1. Performance Test: Total elastic movement should exceed 80 percent of theoretical elastic elongation of stressing length and be less than theoretical elastic elongation of stressing length plus 50 percent of bond length.
2. Proof Test: Total movement between 50 percent of design load and test load, should exceed 80 percent of theoretical elastic elongation of free stressing length for this respective load range.
3. Initial Lift-Off Reading: Shows anchor load within 5 percent of specified lockoff load.

3.12 MANUFACTURER’S SERVICES

A. Inspect and approve onsite tendon and grout and sounding system fabrication and assembly prior to installation.
B. Be present onsite during tendon installation and grouting of at least the first five tendons.
C. Be present during tendon tensioning, performance and proof testing, and lift-off checks for at least the first five tendons.
D. Make necessary documentation to provide Manufacturer’s Certificate of Proper Installation.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. A615, Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
   b. A706, Standard Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement.
   e. C940, Standard Test Method for Expansion and Bleeding of Freshly Mixed Grouts for Preplaced-Aggregate Concrete in the Laboratory.

2. U.S. Army Corps of Engineers (COE):
   a. CRD-C611, Test Method for Flow of Grout Mixtures (Flow Cone Method).
   b. CRD-C621, Corps of Engineers Specification for Nonshrink Grout.

1.02 SUBMITTALS

A. Action Submittals:

1. Placing drawings.
2. Bar details.
3. Manufacturer’s data, recommendations, and instructions for Project-specific use for following products:
   a. Bars.
   b. Couplers/splices.
   c. Grout.

B. Informational Submittals:

1. Test data for couplers/splices.
2. Laboratory test reports for anchor bars showing stress-strain curves and ultimate strengths.
3. Grout test results.
4. Volumes of grout take for each grouting of each anchor hole.
5. Pullout test results.
6. Calibration data for pullout test load measurement system.
7. Record drawings showing final location, elevation, and depth of each anchor bar hole.

PART 2 PRODUCTS

2.01 DOWELS

A. ASTM A615, Grade 60 Deformed Bar.
B. Furnish full length with applicable bends.

2.02 ANCHOR GROUT

A. Prepackaged, requiring only addition of water, and conforming to ASTM C1107, Grade B.
B. Nonmetallic and free of chlorides or other elements or compounds corrosive to steel.
C. Mixed with Water: Pumpable, nonshrink, nonbleeding, and nongas forming.
   1. Time of Efflux: 20 seconds to 30 seconds as determined in accordance with CRD-C611 when initially mixed.
   2. Extended Working Time: Fluid and capable of completely passing flow cone of CRD-C611 for at least 1 hour.
D. Cube Strength: Minimum 2,500 psi at 1 day and 7,000 psi at 28 days when sampled and tested in accordance with CRD-C621.
E. Manufacturers and Products:
   1. Master Builders Co., Cleveland, OH; Master Flow 928.
   2. Euclid Chemical Co., Cleveland, OH; Hi-Flow Grout.

2.03 CONSOLIDATION GROUT

A. Composition:
   1. Portland Cement: ASTM C150, Type II.
   2. Sand: ASTM C33, fine aggregate, except 100 percent shall pass No. 8 sieve.
   3. Water: Clean and free of deleterious substances.
B. Compressive Strength: Minimum 3,500 psi at 14 days.
C. Water-Cement Ratio: Range from 0.40 to 0.45 by weight.
D. Water Loss: Control bleeding by adding sand.

PART 3 EXECUTION

3.01 DRILLING

A. Anchor Locations, Elevations, Depths, and Orientation:
   1. As shown, unless adjusted by Engineer subject to conditions encountered in field.
   2. Final locations, elevations, and depths shall be within plus or minus 0.1 foot and final orientations within plus or minus 5 degrees.

B. Method:
   1. Coring, rotary drilling, or percussion-air-hammer type drilling.
   2. Use water or air with sufficient moisture for dust control to remove cuttings.
   3. Do not use rod dope, grease, or other lubricants in drilling operations.

C. Minimum Hole Diameter: Larger of following.
   1. 1-1/2 times bar diameter.
   2. As required to accommodate grout and vent tubes with bar centered in hole.
   3. 3 inches.

3.02 HOLE PREPARATION FOR ANCHOR INSTALLATION AND GROUTING

A. If water or caving conditions are encountered, fill hole with consolidation grout and drill out grout after it sets. Repeat grouting and redrilling until dry and stable hole is achieved.

B. After completion of dry and stable hole, wash sides of hole with nozzle that impinges water on sides of hole with sufficient velocity to remove loose or caked material from the hole.

C. Immediately prior to anchor installation, refill hole with water if necessary to saturate surfaces, sound hole for compliance with required depth, and remove and dispose of standing water from hole.

D. Prevent entry of unwanted grout, concrete, river sediment, or debris into drilled holes until anchor installation and grouting is completed.
E. Complete grouting same day hole preparation is completed.

3.03 HOLE ABANDONMENT

A. If hole is rejected by Engineer, fill hole with grout as specified for anchor grouting.

B. Drill new hole in location determined by Engineer.

3.04 BAR PREPARATION

A. Immediately prior to installation, remove dirt, grease, loose rust, or other deleterious substances from bar and coupler/splice surfaces and check passages through hollow bars, if used, with air or water to ensure that they are clear.

3.05 VENT AND GROUT TUBE PREPARATION

A. Immediately prior to insertion, check vent and grout tubes with air or water to ensure that they are clear.

3.06 BAR INSTALLATION

A. Install each bar prior to grouting.

B. Rigidly support each bar centered in its hole during placement of grout and until grout sets.

C. Alternatively, install bar after completely filling hole with grout, provided bar can be pushed into position without damage, and grout cannot flow out of hole by gravity.

3.07 VENT AND GROUT TUBE INSTALLATION

A. Insert grout tube with its discharge end at back or bottom of hole, respectively.

B. Grout Tube Diameter: 1 inch, minimum.

C. Vent Tube Diameter: 1/4 inch, minimum.

3.08 MIXING GROUT WITH WATER

A. Mix anchor grout in accordance with manufacturer’s instructions.

B. Equipment used to mix grout shall be capable of achieving uniform mixture, free of lumps, within 3 minutes of time grout is added to water.
C. After each batch is initially proportioned to required consistency, do not add additional water.

D. Do not mix more grout than can be placed within 25 minutes.

3.09 PUMPING GROUT

A. Screen mixed grout prior to pumping through maximum 1/8-inch clear openings. Screen shall be easily accessible for inspection and cleaning.

B. Measure quantity of grout pumped within 0.1 cubic foot.

C. Pump grout at rates sufficient to fill annulus space around bar within working time of grout.

3.10 PLACING GROUT

A. Inject grout at bottom of hole, displacing air and water out of hole.

B. If grout tube is withdrawn, keep grout tube below grout surface until hole is completely filled, and continue pumping as tube is withdrawn.

3.11 TESTING GROUT

A. Fluid Consistency:
   1. Determine time of efflux in accordance with CRD-C611.
   2. One test for each batch mixed.

B. Nonbleeding:
   1. Determine in accordance with ASTM C940.
   2. No surface bleed water present up to 4 hours.
   3. One test each day of grouting.

C. Shrinkage:
   1. Determine in accordance with CRD-C621.
   2. One test each day of grouting.

D. Compressive Strength:
   1. Determine compressive strength of grout cubes sampled and tested in accordance with CRD-C621.
   2. Minimum of one test per day and whenever proportion of mix is changed.
3.12 PULLOUT TESTS

A. Test 5 percent of anchors to verify adequate pullout resistance.

B. Engineer will determine which anchors shall be tested.

C. Test anchors after grout has achieved 4,000 psi compressive strength.

D. Apply test load in tension equal to 6,000 pounds-force for #5 bars and 10,000 pounds-force for #8 bars. Maintain load for minimum of 10 minutes. If bar moves while maintaining test load, or if application of full test load is not possible, anchor will be rejected.

E. Test Apparatus: Conform to ASTM D4435 for each of following items.

   1. Loading system.
   2. Load transducer.
   3. Displacement transducer.
   4. Displacement transducer support.

F. Load measurement systems shall be calibrated by independent testing laboratory and accurate to within plus or minus 5 percent of actual load.

G. Method of load application shall not damage bar.

H. Install replacement anchors for each failed anchor at location determined by Engineer.

I. Retest one additional anchor bar for each failed bar in addition to number initially required.

END OF SECTION
SECTION 32 13 13.13
EXPOSED AGGREGATE CONCRETE PAVING

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. General provisions of Contract, including General and Supplementary Conditions, and Division 01, General Requirements, apply to work specified in this Section.

1.02 SUMMARY OF WORK

A. The work of this Section consists of all paving and related items as indicated on Drawings and/or as specified herein and includes, but is not limited to, the following:

1. Preparation of a concrete base course.
2. Exposed aggregate concrete produced by exposing the coarse aggregate of a gap graded concrete mix.

B. The following items of related work are specified and included in other Sections of the Specifications:

1. Section 03 21 00, Steel Reinforcement.
2. Section 03 30 00, Cast-in-Place Concrete.
3. Section 05 52 10, Site Metal Railings.
4. Section 31 23 13, Subgrade Preparation.
5. Section 31 23 23, Fill and Backfill.
6. Section 31 37 00, Riprap.
7. Section 32 91 13.19, Planting Soil System Procurement.
9. Section 32 93 00, Planting and Fine Grading.
10. Section 33 46 00, Subsurface Drainage.
REFERENCES AND STANDARDS

A. General:

1. The following referenced standards and standard specifications, referred to thereafter by designation only, form a part of this Section. Materials and methods of construction shall comply with the following standards:
   b. In the case of conflict between the Standard Specifications and the requirements of this Section, the more stringent requirements shall apply.

B. All standards shall include the latest additions and amendments as of the date of advertisement for bids. For each type of packaged material required for the Work of this Section, provide manufacturer's certified analysis. For all other materials, provide complete analysis by a recognized approved laboratory made in strict compliance with the standards and procedures of the following:

1. American Association of State Highway and Transportation Officials (AASHTO).
2. American Concrete Institute (ACI).
   a. C31, Practice for Making and Curing Concrete Test Specimens in the Field.
   b. C33, Specification for Concrete Aggregates.
   d. C42, Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete.
   g. C150, Specification for Portland Cement.
   h. C172, Practice for Sampling Freshly Mixed Concrete.
   i. C231, Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.
   k. C494, Specification for Chemical Admixtures for Concrete.
   l. D994, Specification for Preformed Expansion Joint Filler for Concrete.
5. Concrete Reinforcing Steel Institute (CRSI).
1.04 SUBMITTALS

A. Comply with Division 01, General Requirements.

B. Qualifications: Candidate Contractor shall submit at least three project references, including project address, dollar value, Owner's and Landscape Architect's contact information (name, phone, and email).

1. Exposed Aggregate Paving Contractor shall have at least 10 years' experience installing exposed aggregate concrete pavements.

C. Product Information:

1. Provide manufacturer's data showing installation and limitations in use. Supply Certificates of Compliance for all materials required for fabrication and installation, certifying that each material item complies with, or exceeds, specific requirements. Work includes, but is not limited to:
   a. Concrete products.
   b. Aggregates.
   c. Form materials and forming accessories.
   d. Admixtures.
   e. Patching compounds.
   f. Chemical surface retarders.
   g. Curing compound.
   h. Sealants.
   i. Bond breaker material.
   j. Expansion joint material.
   k. Liquid nail adhesive.

D. Samples:

1. Prior to ordering the below listed materials, submit representative samples to Landscape Architect for selection and approval as follows. Do not order materials until Landscape Architect's approval has been obtained. Delivered materials shall closely match the approved samples. Submit duplicate samples of each material listed below showing full range of color variation, finish, and texture that can be expected in the permanent work:
   a. Exposed Aggregate Concrete Paving: Stone mix, duplicate 1-gallon bag.
   b. Bond Breaker Material: 12-inch square.
   d. Chemical Surface Retarder: 1 gallon as packaged by manufacturer.
e. Sealant: 1 gallon as packaged by manufacturer.

E. Concrete Mix Design:

1. Submit certified mix designs at least 3 weeks prior to the beginning of work in accordance with ACI 301 for each class of concrete. Include the following information:
   a. Results of testing or test data used to establish mix proportions.
   b. Test to verify total chloride in content.
   c. Certificates of compliance for:
      1) Contractors design laboratory and ready-mix concrete suppliers certificate of plant inspection.
      2) Cement.
      3) Aggregates, each type.
      4) Admixtures.
      5) Air entrainment.
      6) Curing compounds.
      7) Form Coating.
   d. Reinforcement: Submit certified mill test reports for metal reinforcement and welded wire fabric.

F. Paving sample panels (Mockups): Construct full-size panel of concrete pavement as specified herein to demonstrate the proficiency of the Contractor as well as demonstrate typical joints, surface finish, texture, color, and degree of aggregate exposure. The quality of workmanship, joint treatment and cleanliness of paving sample panel shall be accepted by the Landscape Architect before permanent paving is started. If the original sample is not accepted, the Contractor shall provide additional samples, as required, at no cost to the Owner until an accepted sample is obtained. The approved sample shall become the standard for the entire job. Panel shall not be constructed on a location becoming part of the final paving and shall remain undisturbed until all paving is completed. Remove panel upon completion of paving.

1. Mock-up Panel: Prepare two mock-up panels at the project site approximately 12-foot by 12-foot (minimum).
   a. Contractor shall use the methods and materials proposed for use on the final installation. Uniformity in appearance of each panel shall be the responsibility of the Contractor.
   b. Include Expansion and Control Joints in each sample panel, as well as adjacent items of construction as indicated on Drawings.

G. Material Certificates: Provide copies of materials certificates signed by material producers and Contractor, certifying that each material item complies with, or exceeds, specific requirements.
H. Pour Schedule: Contractor to indicate on plans locations sequence of pours for review by Landscape Architect.

I. Field quality-control test reports.

1.05 QUALITY ASSURANCE

A. Comply with the requirements of ACI 301.

B. Manufacturer Qualifications:

1. Manufacturer of ready-mixed concrete products complying with ASTM C94 requirements for production facilities and equipment.
   a. Manufacturer must be certified according to the National Ready Mix Concrete Association’s Plant Certification Program.

2. Manufacturer of with 10 years’ experience in manufacture of specified products.

C. Source Limitations:

1. Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant and each aggregate from one source.

2. Obtain each specified material from same source and maintain high degree of consistency in workmanship throughout Project.

D. Installer Qualifications: A qualified exposed aggregate concrete installer whose work has resulting in successful installation of exposed aggregate concrete pavements. Use adequate numbers of skilled workers who are trained in the necessary crafts and who are completely familiar with the specified requirements and methods needed for the proper performance of the work of this Section.

E. Workmanship: The Contractor is responsible for correction of concrete work that does not conform to the specified requirements, including strength, tolerances, grading and finishes.

F. Mockups: Cast mockups of full-size sections of concrete pavement to demonstrate typical joints, surface finish, texture, color, degree of aggregate exposure and standard of workmanship.

1. Build mockups in the location and of the size indicated or, if not indicated, as directed by Landscape Architect.

2. Notify Landscape Architect 7 days in advance of dates and times when mockups will be constructed.
3. Obtain Landscape Architect's approval of mockups before starting construction.
4. Maintain approved mockups during construction in an undisturbed condition as a standard for judging the completed pavement.
5. Demolish and remove approved mockups from the site when directed by Landscape Architect.
6. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

G. Preinstallation Conference: One week prior to placement of concrete, a meeting shall be held to discuss the Project and application methods. Conduct conference at Project site to comply with requirements in Section 01 31 13, Project Coordination.

1. Before submitting design mixtures, review concrete pavement mixture design and examine procedures for ensuring quality of concrete materials and concrete pavement construction practices. Require representatives, including the following, of each entity directly concerned with concrete pavement, to attend conference:
   a. Landscape Architect.
   b. Construction Manager.
   c. General Contractor's superintendent.
   d. Independent testing agency responsible for concrete design mixtures.
   e. Ready-mix concrete producer.
   f. Concrete pavement subcontractor.
   g. Owner.

H. Provide a schedule of concrete placements to the Owner and Landscape Architect so that formwork and reinforcement installations can be reviewed prior to concrete placements.

1. Notify the Owner and Landscape Architect at least 72 hours before placement of concrete for review of forms, form liners, and reinforcement. No concrete shall be placed without this review and acceptance by Landscape Architect.

I. Notification of Landscape Architect shall be given at least 1-week before start of Work.

J. Layout and Grading: After staking out the work, and before beginning final construction, obtain the Landscape Architect's approval for layout and grades.

1. Contractor shall make adjustments as determined by the Landscape Architect. Landscape Architect may make adjustments to grades and
layout as is required to meet existing and proposed conditions without additional cost to the Contract price.

2. The Contractor shall not proceed with the work of this Section without obtaining the Landscape Architect's written acceptance of layout and grading.

3. Comply with Division 01, General Requirements, Section 31 23 16, Excavation, Section 31 23 23, Fill and Backfill, and Section 32 93 00, Planting and Fine Grading.

K. Tests for Concrete Materials: Materials and installed work may require testing and retesting, as directed by the Landscape Architect and the Construction Manager, at any time during the process of the work. Allow free access to material stockpiles and facilities at all times. Tests, not specifically indicated to be done at the Owner's expense, including the retesting of rejected materials and installed work, shall be done at the Contractor's expense.

L. Concrete Quality Control Testing During Construction:

1. An independent testing laboratory will be retained by the Construction Manager to perform all quality control tests and to submit test reports to the Landscape Architect and Construction Manager.
   a. The independent firm will perform inspections, tests, and other services specified and as required by the Landscape Architect and Construction Manager.
   b. Reports will be submitted by the independent firm to the Landscape Architect, Owner and Construction Manager indicating observations and results of tests and indicating compliance or noncompliance with Contract Documents.
   c. The Contractor shall cooperate with the independent testing firm; furnish samples of materials, design mix, equipment, tools, storage and assistance as requested.
      1) Notify Construction Manager, Landscape Architect, and independent firm 48 hours prior to expected time for operations requiring services.
      2) Make arrangements with independent firm and pay for additional samples and tests required for Contractor's use.
   d. Retesting required because of nonconformance to specified requirements shall be performed by the same independent firm on instruction by the Landscape Architect or Construction Manager. Payment for retesting will be charged to the Contractor by deducting inspection or testing charges from the Contract Sum/Price.
2. Sample and test concrete during placement of concrete as follows:
   a. Sampling Fresh Concrete: ASTM C172; except modified for slump to comply with ASTM C94.
   b. Slump: ASTM C143; one test for each concrete load at point of discharge and one for each set of compressive strength test specimens.
   c. Air Content: ASTM C231; pressure method; one for each set of compressive strength specimens.
   d. Compressive Strength Tests: ASTM C39; one set for each 150 cubic yards or fractions thereof, of each concrete class placed in any one day or for each 5,000 square feet of surface area placed; two specimens tested 7 days, three specimens tested 28 days and one specimen retained in reserve for later testing if required.

1.06 EXAMINATION OF CONDITIONS

A. The Contractor shall fully inform himself of existing conditions of the site before submitting his bid and shall be fully responsible for carrying out all site work required to fully and properly execute the work of the Contract, regardless of the conditions encountered in the actual work. No claim for extra compensation or extension of time will be allowed on account of actual conditions inconsistent with those assumed.

B. Plans, surveys, measurements and dimensions under which the work is to be performed are believed to be correct to the best of the Owner's knowledge, but the Contractor shall have examined them for themselves during the bidding period, as no allowance will be made for any errors or inaccuracies that may be found therein.

1.07 JOB CONDITIONS

A. Protection: The Contractor shall use all means necessary to protect the materials of this Section before, during, and after installation. In the event of damage, make all repairs and replacements necessary to the approval of the Landscape Architect and at no additional cost to the Owner. All work shall be executed in a manner so as to prevent any damage to existing wall, rails, paving, and plant materials.
B. Protection of Existing Planting Soils:

1. Planting soils next to paved areas will be in place. The Contractor shall take extreme measures to protect the planting soil at all times and shall adhere to the following procedures and precautions:
   a. The storage and driving of machinery and equipment over planting soils is expressly prohibited. Prevent workers from walking on the surface of the planting soils.
   b. No materials shall be stored or placed on the planting soils at any time.
   c. Protect planting soils to prevent the intermingling of concrete materials before, during and after concrete placement. Review methods of protection with the Construction Manager before beginning work.
   d. Where planting soils are damaged, contaminated, over compacted, or otherwise harmed, remove those soils and replace with the approved planting soils. The Landscape Architect and Owner shall be the sole authorities on determining the need for plant soil replacement.
   e. Also refer to Section 32 91 19.13, Planting Soil System Installation.

PART 2 PRODUCTS

2.01 SUBGRADE AND BASE MATERIALS

A. Subgrade preparation shall conform to the requirements of Section 31 23 13, Subgrade Preparation, and Section 32 91 19.13, Planting Soil System Installation.

B. Granular fill for subbase course shall conform to the requirements of Section 31 23 23, Fill and Backfill.

2.02 FORMS

A. Unless otherwise indicated, construct formwork with plywood, metal, metal framed plywood faced or other acceptable panel type materials to provide continuous, straight, smooth, exposed surfaces.

1. Provide form material with sufficient thickness to withstand pressure of newly placed concrete without bow or deflection.
2. Provide forms that comply with US Product Standard PS 1 and the following:
   a. B-B High Density Overlaid Concrete Form, Class I.
ZINK DAM IMPROVEMENTS

b. B-B (Concrete Form) Plywood, Class I, exterior grade or better, mill oiled and edge sealed, with each piece bearing legible inspection trademark.

B. Form Coatings: Provide commercial formulation form-coating compounds that will not bond with, stain, nor adversely affect concrete surfaces, and will not impair subsequent treatments of concrete surfaces.

C. Form Ties: Provide factory-fabricated, adjustable-length, removable or snapoff metal form ties, designed to prevent form deflection, and to prevent spalling concrete surfaces upon removal.

1. Unless otherwise indicated, provide ties so portion remaining within concrete after removal is at least 1/2-inch inside concrete for steel ties and 1/4-inch for wire ties.
2. Unless otherwise indicated, provide form ties that will not leave holes larger than 1-inch diameter in concrete surface.

2.03 REINFORCEMENT MATERIALS

A. General:

1. Where indicated on Drawings, all reinforcing shall be epoxy-coated steel unless otherwise indicated.
2. Certified copies of mill reports for all reinforcing shall be submitted before reinforcing is placed.
3. Bars shall be correctly rolled to section and free from surface defects.
4. Splices in reinforcing shall be as specified in Article Placing Reinforcement.
5. Reinforcement shall be kept clean from oil, dirt and loose mill scale or other coating.
6. Shop fabricate reinforcing bars to conform to required shapes and dimensions, with fabrication tolerances complying with ACI 315. In case of fabricating errors, do not rebend or straighten reinforcement in manner that will injure or weaken material.

B. Epoxy-Coated Welded Wire Fabric: Comply with ASTM A884/A884M, Class A, plain steel epoxy coated. Wire fabric shall have a minimum ultimate strength of 70,000 psi.

C. Epoxy-Coated Reinforcement Bars: Comply with ASTM A775/A775M; and with ASTM A615/A615M, Grade 60 (Grade 420), deformed new billet steel bars.
D. Epoxy-Coated Wire: Comply with ASTM A884/A884M, Class A coated, plain steel.

E. Epoxy-Coated Joint Dowel Bars: Comply with ASTM A775/A775M; and with ASTM A615/A615M, Grade 60 (Grade 420), plain steel bars, epoxy coated.

F. Epoxy Repair Coating: Liquid two-part epoxy repair coating, compatible with epoxy coating on reinforcement.

G. Reinforcement Accessories:
   1. Tie wire, plastic coated, for use with epoxy coated reinforcing.
   2. Mechanical Reinforcing Bar Connectors: Comply with ACI 301. Provide 125 percent minimum yield strength of the reinforcement bar. Coat connectors in accordance with the same requirements as reinforcing bars.

H. Other accessories, at the option of the Contractor, may be zinc coated, except on exposed surfaces which have plastic tipped accessories.

I. Supports for Reinforcement: Provide supports for reinforcement, including bolsters, chairs, spacers, and other devices for spacing, supporting and fastening reinforcing bars, and welded wire fabric in place.
   1. Use wire bar type supports complying with CRSI recommendations, unless otherwise indicated. Do not use wood, brick, stone, broken block or pieces of concrete.
   2. For concrete-on-grade, use supports with sand plates or horizontal runners if base material will not adequately support chair legs.
   3. For exposed-to-view concrete surfaces, where legs of supports are in contact with forms, provide supports with legs which are plastic protected, stainless steel protected, or special stainless complying with CRSI Classes C, D, or E respectively.
   4. The top wire of all spacers, bolsters and chairs shall be corrugated.

2.04 CONCRETE MATERIALS

A. Portland Cement: ASTM C150 Types I, II, and III, "Low-Alkali" cement, unless otherwise specified. Use one brand of cement from the same manufacturer throughout Project.
B. Aggregates: Aggregate for exposed aggregate concrete shall be 5/8-inch round, tan in color, as supplied by a source approved by Landscape Architect.

1. Aggregate to match Landscape Architect's sample.
2. Aggregate shall be 5/8-inch round, tan in color, with the following sieve graduation:

<table>

</table>

C. Water: Potable, clean, fresh, free from oil, acid, organic matter or other deleterious substances.

D. Admixtures: All admixtures shall be specified in the mix design.

2. Water-Reducing Admixture: ASTM C494, Type A.
3. Water-Reducing, Retarding Admixture: ASTM C494, Type D.
4. Chloride-containing admixtures are not permitted.

2.05 ACCESSORIES

A. Expansion joint material shall be Homex 300 Expansion Joint Filler, 1/2-inch thickness as manufactured by the Homasote Company, West Trenton, New Jersey, (800) 257-9491, “or-equal.”

B. Bond Breaker Fabric: Nonwoven type polypropylene geotextile fabric, 4 oz. weight, shall be Mirafi 140N, “or-equal.”

C. Bonding Agent: VOC compliant, high solids acrylic latex emulsion admixture, non-oxidizing, white pigment, dries clear.
D. Chemical Surface Retarders: Spray-applied, film forming top surface retarder, calibrated for specific sized aggregates and finish requirements without the use of a plastic covering.

1. Acceptable Materials:
   a. Top Cast 75 as manufactured by Dayton Superior Corporation, 1125 Byers Road, Miamisburg, OH 45342, www.daytonsuperior.com, (888) 977-9600.
   b. “Or-equal.”

E. Surface Sealer: A clear, non-yellowing, water-based curing and sealing compound with matte finish to protect surface from environmental effects and pedestrian and vehicular traffic.

1. Acceptable Materials:
   b. “Or-equal.”

2.06 CONCRETE MIX

A. Prepare design mixes, proportioned according to ACI 211.1 and ACI 301, for each type and strength of normal-weight concrete determined by laboratory trial mixes.

B. Use a qualified independent testing agency for preparing and reporting proposed mix designs for the trial batch method.

1. Do not use Owner's field quality-control testing agency as the independent testing agency.

C. Exposed Coarse Aggregate Concrete:

1. Use "Ready Mixed" concrete unless otherwise approved or specified; in accordance with ASTM C94. Exposed Coarse Aggregate Concrete should meet or exceed the following criteria:
   a. Compressive Strength: Minimum 4,500 psi strength at 28 days.
   b. Concrete shall be gap-graded with weathered rounded coarse aggregate.
   c. Water/Cement Ratio: Not greater than 0.40 by weight.
   d. Slump: 5 inches, plus or minus 1 inch.
   e. Air Content: Between 4.5 percent to 7.5 percent.
PART 3  EXECUTION

3.01  GENERAL
A. Construct exposed aggregate paving true to line, elevation, pitch and section. All paving shall pitch to drain. Concrete pavement shall be brought to true plane surfaces with a finished tolerance of 1/8-inch total in 10 feet when measured with a 10-foot straight edge.

3.02  SURFACE CONDITIONS
A. Examination: Prior to Work of this Section, carefully inspect the installed Work of other trades and verify that such Work is complete to the point where this installation may properly commence.

B. Discrepancies:
   1. In the event of discrepancy, immediately notify the Landscape Architect.
   2. Do not proceed with installation in areas of discrepancy until such discrepancies have been fully resolved.

3.03  PREPARATION
A. The installer shall examine previous work, related work, and conditions under which this work is to be performed and notify the Contractor in writing of all deficiencies and conditions detrimental to the proper completion of this work. Beginning work means installer accepts previous work, and conditions.

B. Preparation of subgrade and aggregate subbase shall be in accordance with Section 312313, Subgrade Preparation.

C. Remove loose material from compacted subbase surface immediately before placing concrete.

D. Proof roll prepared subbase surface to check for unstable areas and areas requiring additional compaction.

E. Confirm in writing that the Landscape Architect has accepted the layout and grades for walkways.

F. Notify Construction Manager of unsatisfactory conditions. Do not begin paving work until deficient subbase areas have been corrected and are ready to receive paving.
3.04 FORM SETTING

A. Design, erect, support, brace and maintain formwork to support vertical and lateral loads that might be applied until such loads can be supported by concrete structure.

B. Fabricate formwork to be readily removable without impact, shock or damage to cast-in-place concrete surfaces and adjacent materials.

C. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for pavement to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least 24 hours after concrete placement.

D. Clean forms after each use and coat with form release agent to ensure separation from concrete without damage.

E. All concrete edges for all pavement, foundations, curbs and other below grade work shall be formed or contained to prevent over pouring of concrete. Excess concrete shall be removed as directed by the Landscape Architect.

F. Set forms to provide the proper depth of compacted concrete as detailed on the Drawings, firmly stake in place, tops set at the exact finish grade.

G. Notify the Landscape Architect at least 72 hours before placement of concrete for review of forms, form liners, and reinforcement. Obtain Landscape Architect's approval of formwork prior to placing concrete. All formwork requires approval by Landscape Architect prior to placement of concrete. No concrete shall be placed without this review and acceptance.

   1. Contractor shall make adjustments as determined by the Landscape Architect. Landscape Architect may make adjustments to grades and layout as is required to meet existing and proposed conditions without additional cost to the Contract price.

3.05 JOINTS

A. Control Joints: Contractor to provide a plan showing location of control joints to Landscape Architect for Approval before Concrete is placed. Saw cut to the depth shown on Drawings. Strictly adhere to the pattern agreed to with Landscape Architect. Review layout of control joints in the field with the Landscape Architect before proceeding with work.
B. General: Construct construction, expansion, and control joints and tool edgings true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated.

1. When joining existing pavement, place transverse joints to align with previously placed joints, unless otherwise indicated.
2. Joints in the topping slab above the joints in the base slab should match the locations of joints in the base slab, where possible.

C. Construction Joints: Set construction joints at side and end terminations of pavement and at locations where pavement operations are stopped for more than one-half hour, unless pavement terminates at expansion joints.

1. Continue reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of pavement strips, unless otherwise indicated.
2. Butt joint with dowels or use a thickened edge joint if construction joints occur at control joint locations.
3. Keyed joints with tie-bars shall be used if the joint occurs at any other location.
4. Use a bonding agent at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
5. Review location of construction joints with the Landscape Architect.

D. Expansion Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, walks, other fixed objects, and where indicated.

1. Contractor to provide a plan showing location of expansion joints to Landscape Architect for Approval before Concrete is placed. Strictly adhere to patterning and layout agreed to with Landscape Architect when formwork is in place but before concrete is placed. If pattern cannot be achieved, or is unclear, consult with Landscape Architect before placing concrete. Do not proceed with concrete placement without approval from Landscape Architect on patterning. Do not proceed in uncertainty.
2. Extend expansion joint the full width and depth of joint. Set top of expansion joint flush with finish grade.
3. Install expansion joints flush with the finish grade of the exposed aggregate concrete.
4. Install expansion joints around buildings, and other vertical structures adjacent to the concrete.
5. Chemically fasten one side of expansion joint materials to one side of materials requiring separation. Fasten with "Liquid Nail", or equivalent, using formula appropriate to materials being fastened.

6. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.

E. Control Joints:

1. Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct control joints for a depth equal to at least one-fourth of the concrete thickness, as follows:
   a. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch-wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.
   b. Contractor to provide a plan showing location of control joints to Landscape Architect for approval before Concrete is placed. Mark control joints on the form work. If pattern cannot be achieved, or is unclear, consult with Landscape Architect before placing concrete. Do not proceed with concrete placement without approval from Landscape Architect on patterning.

F. Edging: Tool edges of pavement and expansion joints in concrete after initial floating with a 1/4-inch radius edging tool. Repeat tooling of edges after applying surface finishes. Eliminate tool marks on concrete surfaces by lightly brooming or troweling. Window paning of concrete shall not be acceptable.

3.06 PLACING REINFORCING

A. General:

1. Where indicated on Drawings, place reinforcing as specified herein.
2. Wherever embedded items interfere with placing of reinforcement notify the Landscape Architect and obtain approval before placing any concrete. Do not bend or field cut bars around openings or sleeves.

B. Placing:

1. Do not exceed the tolerances specified in ACI 117.
2. Dowels shall be tied securely in place before concrete is deposited. In the event there are no bars in position to which dowel may be tied, No. 3 bars (minimum) shall be added to provide proper support and anchorage.
3. Install welded wire fabric in as long lengths as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.

C. Field bending or straightening in accordance with Section 3.3.2.8 of ACI 301.

D. Spacing of Reinforcing: Where Drawings do not show the spacing of the reinforcing, the minimum clear spacing shall conform to ACI 318 Section 7.6.

E. Concrete Cover: Place reinforcement to obtain as a minimum the coverages for concrete protection specified in Section 3.3.2.3 of ACI 301.

F. Splicing: Make splices only at those locations shown on Drawings or as accepted by the Landscape Architect. Stagger splices in adjacent bars wherever possible. Splicing shall conform to the requirements of ACI 310 and specified provisions.

G. Reinforcing Supports:

1. Reinforcement shall be accurately located in the forms and held in place by means of supports adequate to prevent displacement and to maintain reinforcement at proper distance from form face. The use of wood supports and spacers inside the forms is not permitted.

2. Support reinforcement supported from the ground on precast concrete reinforcement supports.

3. Do not use reinforcing supports or reinforcing to support concrete conveying equipment and similar construction loads.

H. Tying:

1. Reinforcing shall be rigidly and securely tied with steel tie wire. Tie wires, after cutting, shall be bent in such a manner that concrete placement will not force the wire ends to surface of exposed concrete.

2. Set wire ties so that twisted ends are directed away from exposed concrete surfaces.

3. Reinforcing in concrete members that have one or more surfaces exposed, whether painted or unpainted finish, shall be tied with galvanized wire. Uncoated tie wire in exposed members will not be accepted.

I. Install deformed bar anchors in accordance with the manufacturer's recommendations.

J. Install mechanical splices and reinforcing couplers in accordance with manufacturers' recommendations.
K. Installation of manufactured products as per Part 2 of this specification and according to manufacturers' recommendation.

L. Cleaning:
   1. Clean reinforcement to remove loose rust and mill scale, earth and other materials which might reduce or destroy bond with concrete.
   2. Where there is a potential of rust staining adjacent finish surfaces, take necessary steps to prevent staining.

3.07 MIXING CONCRETE

A. Ready Mix and Site Produced Concrete:
   1. Comply with ASTM C94.
   2. The batching plant shall be equipped with an electric metering device capable of determining moisture content of sand.
   3. The addition of water at the site is contingent upon full time inspection of the process by the owners testing laboratory and the acceptance of the Inspector, Comply with ACI 301, Section 4.3.2.1.
   4. Begin the mixing operation within thirty minutes after the cement has been intermingled with the aggregates.

3.08 CONCRETE PLACEMENT

A. Inspection: Before placing concrete, inspect and complete formwork installation, reinforcement steel, and items to be embedded or cast in. Notify other trades to permit installation of their work.

B. Remove snow, ice, or frost from subbase surface and reinforcement before placing concrete. Do not place concrete on frozen surfaces.

C. Moisten subbase to provide a uniform dampened condition at the time concrete is placed. Do not place concrete around manholes or other structures until they are at the required finish elevation and alignment.

D. Comply with requirements and with recommendations in ACI 304R for measuring, mixing, transporting, and placing concrete.

E. Do not add water to concrete during delivery, at Project site, or during placement without approval from the Landscape Architect and Owner's testing agency.
F. Deposit and spread concrete in a continuous operation between expansion joints. Do not push or drag concrete into place or use vibrators to move concrete into place.

G. Consolidate concrete by mechanical vibrating equipment supplemented by hand-spading, rodding, or tamping. Use equipment and procedures to consolidate concrete according to recommendations in ACI 309R.

1. Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand-spreading and consolidation. Consolidate with care to prevent dislocating reinforcement, dowels, and joint devices.

H. Screed pavement surfaces with a straightedge and strike off. Commence initial floating using bull floats or darbies to form an open textured and uniform surface plane before excess moisture or bleed water appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations.

I. Cold-Weather Placement: Comply with ACI 306.1 and as follows. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.

1. When air temperature has fallen to or is expected to fall below 40 degrees F, uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 degrees F and not more than 80 degrees F at point of placement.
2. Do not use frozen materials or materials containing ice or snow.
3. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators, unless otherwise specified and approved in mix designs.

J. Hot-Weather Placement:

1. Place concrete according to recommendations in ACI 305R and as follows when hot-weather conditions exist:
   a. Cool ingredients before mixing to maintain concrete temperature at time of placement below 90 degrees F. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
   b. Cover reinforcement steel with water-soaked burlap so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
c. Fog-spray forms, reinforcement steel, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

3.09 EXPOSED AGGREGATE FINISHING PROCESS

A. General: Do not use tools such as jitterbugs that force the aggregate away from surface.

1. After screeding and consolidating concrete slabs, do not work surface until ready for floating.
2. As soon as concrete will support the mason on knee-boards, float the surface to bring grout to the surface, completely surrounding the aggregate and filling all surface voids. Float to a uniform appearance.

B. Exposing Aggregate: Proceed as soon as the surface grout can be removed by simultaneous brushing and flushing with water without overexposing or dislodging the aggregate. Avoid traffic on the concrete during this operation. High pressure water may be used if desired finish is more easily achieved without harm to the concrete. Use same method of exposure, either with or without retarder, throughout the job. The exposed aggregate shall have a 3/16-inch depth of exposure. The depth of exposure shall be measured by laying a straight edge across the plane of the surface and measuring down to the concrete matrix.

C. Edging: Tool edges of pavement and expansion joints in concrete after initial floating with a 1/4-inch radius edging tool. Repeat tooling of edges after applying surface finishes. Eliminate tool marks on concrete surfaces by lightly brooming or troweling. Window paneing of concrete shall not be acceptable.

3.10 CONCRETE PROTECTION AND CURING

A. General:

1. Protect Paving by not allowing use for a minimum of 7 days after installation is complete.
2. Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and follow recommendations in ACI 305R for hot-weather protection during curing.
B. All rules and regulations governing respective utilities shall be observed in executing all work under this Section. All work shall be executed in such a manner as to prevent any damage to soils, curbs, paving, walls, stone work, utility lines, structures, plant materials and adjoining property.

1. For protection of soils, refer to Part 1 in this Section.

C. Strip forms 7 days after installation is complete.

D. Apply matte sealer as per approved mockup to protect surface from environmental effects and pedestrian and vehicular traffic.

3.11 REPAIRS

A. Patching Defective Areas: Immediately cut out honeycomb, rock pockets and voids over 1/4-inch (6mm) in any dimension as well as holes left by tie rods, bolts, etc. down to solid concrete but, in no case to a depth less than 1 inch (25 mm).

1. Cut edges perpendicular to concrete surface.
2. Thoroughly clean, dampen with water, and brush coat area to be patched with neat cement grout or proprietary bonding agent before placing cement mortar or proprietary patching compound.

B. Remove and replace concrete with defective surfaces if defects cannot be repaired to the satisfaction of the Landscape Architect.

1. Surface defects include color and texture irregularities, cracks, spalls, air bubbles, honeycombs, rock pockets, fins and other projections on the surface as well as stains and other discolorations that cannot be removed by cleaning.
   a. Dampen concrete surfaces in contact with patching concrete and brush with neat cement grout or apply concrete bonding agent.
   b. Mix Patching concrete of same materials to provide concrete of same type of class as original concrete.
   c. Place, compact and finish to blend with adjacent finished concrete. Cure in same manner as adjacent concrete.

C. Remove and replace concrete pavement that is broken, damaged, or defective, or does not meet requirements in this Section.

1. Damaged concrete shall be removed to a full joint and replaced. Partial patching within the sidewalk shall not be accepted. Landscape Architect shall determine extent of removal and replacement.
D. Drill test cores where directed by Landscape Architect when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory pavement areas with portland cement concrete bonded to pavement with epoxy adhesive.

3.12 FINAL CORRECTION

A. The Landscape Architect reserves the right to inspect the work to determine if adjustments are necessary in grade, alignment or layout. The Contractor shall make such adjustments without further compensation.

3.13 PROTECTION OF FINISHED WORK

A. Protect concrete from damage until final inspection by the Landscape Architect and Final Acceptance of the Project.

B. Exclude traffic from pavement for at least 7 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur.

C. Maintain concrete pavement free of stains, discoloration, dirt, and other foreign material. Sweep concrete pavement not more than 2 days before date scheduled for Substantial Completion inspections.

3.14 CLEAN-UP

A. The Contractor shall remove all debris, construction equipment and scrap material from all areas within the limit of work prior to the final inspection and acceptance.

B. The Contractor shall clean all stains from the surface of paving. Paving which cannot be cleaned shall be replaced. Landscape Architect shall be sole judge of whether staining is apparent and necessitates remediation.

END OF SECTION
PART 1    GENERAL

1.01 RELATED DOCUMENTS

   A. Drawings and general provisions of the Contract, including General and
      Supplementary Conditions, and Division 01, General Requirements
      Specification Sections, apply to this Section.

   B. Refer to other Divisions of these Specifications to determine the type and
      extent of work therein affecting the work of this trade, whether or not such
      work is specifically mentioned in this Section.

1.02 WORK OF THIS SECTION

   A. The work of this Section consists of all site improvements and related items as
      indicated on Drawings and/or as specified herein and includes, but is not
      limited to, the following:

      1. Gate at site entry.
      2. Range fence and gates.
      3. Snow fence.

1.03 RELATED SECTIONS

   A. The following items of related work are specified and included in other
      Sections of the Specifications:

      1. Section 03 30 00, Cast-in-Place Concrete.
      2. Section 31 23 16, Excavation.
      3. Section 31 23 23, Fill and Backfill.
      4. Section 32 13 13.13, Exposed Aggregate Concrete Paving.
      5. Section 32 91 13.19, Planting Soil System Procurement.
      7. Section 32 92 01, Prairies, Meadows, and Wetlands.
      8. Section 32 93 00, Planting and Fine Grading.
1.04 EXAMINATION OF CONDITIONS

A. The Contractor shall fully inform themselves of existing conditions of the site before submitting their bid and shall be fully responsible for carrying out all site work required to fully and properly execute the work of the Contract, regardless of the conditions encountered in the actual work. No claim for extra compensation or extension of time will be allowed on account of actual conditions inconsistent with those assumed.

B. Plans, surveys, measurements and dimensions under which the work is to be performed are believed to be correct to the best of the Landscape Architect's knowledge, but the Contractor shall have examined them for himself during the bidding period, as no allowance will be made for any errors or inaccuracies that may be found therein.

1.05 SCHEDULING

A. Comply with Division 01, General Requirements.

B. The Contractor shall submit to the Landscape Architect, for approval by the Owner, a progress schedule for all work as specified herein in accordance with General Conditions.

1.06 QUALITY ASSURANCE

A. Comply with Division 01, General Requirements.

B. General: Materials, methods of fabrication, fitting, assembly bracing, supporting, fastening, operating devices, and erection shall be in accordance with Contract Documents, approved Shop Drawings, and shall be of highest quality practices in the industry. Use new and clean materials as specified, having structural properties sufficient to safely sustain or withstand stresses and strains to which materials and assembled work will be subjected. All work shall be accurately and neatly fabricated, assembled, and erected.

1. Parts not specifically identified shall be made of materials most appropriate for their intended use as approved by Landscape Architect.

2. Profiles and sizes of exposed surfaces shown shall be maintained as indicated.

3. Insofar as possible, all materials and equipment used in the installation of this work shall be of the same brand or manufacturer throughout all work and duration of total project for each class of material or equipment. Conform to Reference Standards as a minimum.

4. Comply with specified Performance Requirements as a minimum.
C. Materials and methods of construction shall comply with the following standards:

1. American Galvanizers Association (AGE):
   a. AGA T-IPAF: The Inspection of Products to be Hot-Dip Galvanized after Fabrication Including a New Section on Touch-Up and Repair.
   b. AGA D-PGAF: The Design of Products to be Hot-Dip Galvanized after Fabrication.

D. Qualifications for Fabrication and Installation: With respect to item or assembly, work of this Section shall be fabricated and installed by an experienced fabricator or manufacturer, who has been engaged in work of equivalent scope and fabrication standards for at least 5 years.

1. Qualifications of Welders: Welding shall be done only by certified welding operators currently qualified according to AWS D1.1.
2. Qualifications of Workmen: Use adequate numbers of skilled workers who are trained in the necessary crafts and who are completely familiar with the specified requirements and methods needed for the proper performance of the work of this Section.
3. Field Measurements: Take field measurements prior to preparation of Shop Drawings and fabrication, where possible. Do not delay job progress; allow for trimming and fitting where taking field measurements before fabrication might delay work.

E. Shop Assembly: Pre-assemble and fit items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for re-assembly and coordinated installation.

1. Connections for installation of assemblies in field shall be by approved mechanical fasteners. Welding of assemblies or components on-site shall not be permitted unless specifically shown on Drawings as a field
weld and/or is approved by Landscape Architect specific to a condition of installation.

F. Layout and Grading: After staking out the work, and before beginning final construction, obtain the Landscape Architect’s approval for layout and grades. Contractor shall make adjustments as determined by the Landscape Architect. The Landscape Architect may make adjustments to grades and layout as is required to meet existing and proposed conditions without additional cost to the Contract price.

1.07 SUBMITTALS

A. Comply with Division 01, General Requirements.

B. Product Information:

1. Provide manufacturer’s data showing installation and limitations in use. Supply Certificates of Compliance for all materials required for fabrication and installation, certifying that each material item complies with, or exceeds, specific requirements. Work includes but is not limited to:
   a. Metal components.
   b. Range fence cable system and hardware.
   c. Hot-dipped galvanizing.
   d. Gates, latches and hinges.
   e. Snow fence, T-posts and clips.

C. Samples:

1. Prior to ordering the below listed materials, submit representative samples to Landscape Architect for selection and approval as follows. Do not order materials until Landscape Architect's approval has been obtained. Delivered materials shall closely match the approved samples. Submit duplicate samples of each type listed below showing full range of color variation, finish and texture that can be expected in the permanent work:
   a. Snow fence, 2-foot wide, full height sample.
   b. Snow fence “T” Post, one full size sample.
   c. Service gates, all components.

D. Shop Drawings:

1. Field Measurements: Take accurate field measurements, if necessary, before preparation of Shop Drawings and fabrication. Do not delay job progress.
2. Shop Drawings shall show all details, including sizes, materials, quantities and manner of assembling the various members, properly coordinated with the related work. Shop Drawings shall show plans, elevations, true profiles, installation details, methods of anchoring hardware, if any, and all other necessary information. Work includes but is not limited to:
   a. Range fence and gates.
   b. Service gates.

E. Samples Panels: Upon approval of all material samples, the Contractor shall construct sample panels on site in the minimum size indicated below. Each sample panel shall be large enough to display typical characteristics of each item and type of work. The visual characteristics, quality of workmanship, and installation methods must be approved by the Landscape Architect before final work is started. If the original sample is not approved, the Contractor shall provide additional samples, as required, at no cost to the Owner until an approved sample is obtained. The approved sample shall become the standard for the entire job. Sample panel shall not be constructed on a location becoming part of the final work, unless otherwise noted, and shall remain undisturbed until all work is completed. Contractor shall completely remove any panels not set in place as part of the final work, from the site upon final acceptance of work.

1. Sample Panel Requirements:
   a. Range Fence: One full fence segment, including an end brace and corner condition and, if approved, components may be used in permanent installation at location designated by the Landscape Architect.
   b. Range Fence Gate: One full gate, showing latches, hinges and mid-support connections. If approved, components may be used in permanent installation at location designated by the Landscape Architect.

1.08 DELIVERY, STORAGE AND HANDLING

A. Clearly label contents of all packaging and crating delivered to site.

B. Finished Materials: Protect finishes of fabricated items against soiling, staining, or damage from scratches and abrasion. Maintain protection during construction and until Owner acceptance and use of Project.

C. Storage of Materials: Materials that are stored at the project site shall be above ground on platforms, skids, or other supports. Protect steel from corrosion. Store other materials in a weather-tight and dry place until ready for use.
D. Replacements: In the event of damage, immediately make all repairs and replacements necessary to the approval of Landscape Architect at no additional cost to the Owner.

PART 2 PRODUCTS

2.01 MATERIALS

A. Metals, General: Provide metal materials that have been selected for their surface flatness, smoothness, and freedom from surface blemishes. Surfaces that exhibit pitting, seam marks, roller marks, “oil-canning,” burrs, rough-ground ends, stains, discolorations, or other imperfections on the finished units shall not be used and will not be acceptable.

B. Carbon Steel:

1. Carbon Steel Plates, Shapes, and Bars: Conform to ASTM A36 unless otherwise indicated.
2. Steel Tubing: Cold formed, conforming to ASTM A500; or hot rolled, conforming to ASTM A501.
3. Steel Pipe: Conform to ASTM A53, standard weight (Schedule 40), unless otherwise indicated or required by engineering to suit condition.
4. Hot Dip Galvanizing: Refer to Article Galvanizing of this Section.

C. Corrosion Resisting Weathering Steel:

1. Pipe and tubing conforming to ASTM A847, structural tubing.
2. Plates, caps, tabs and shapes conforming to ASTM A588, Grade 50.

D. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes shall be as recommended by producer of metal to be welded, and as required for color match, strength, and compatibility in the fabricated item. Comply with AWS D1.1 or AWS D1.6 as applicable to item and as a minimum.

E. Galvanize Repair Coating: For touching up galvanized surfaces after erection, provide Z.R.C. Cold Galvanizing Compound by Z.R.C. Chemical Products Co. or approved equal. Galvanize repair coating/compound material shall contain a minimum 95 percent zinc by weight in dry film.

F. Supplementary Parts:

1. Provide as necessary to complete each item of work, even though such supplementary parts are not shown or specified.
2. Reference additional miscellaneous metal items and components required by fabrications specified herein.

2.02 GALVANIZING

A. Scope: Where indicated on Drawings or as specified herein, ferrous metal items shall be cleaned and then hot-dipped galvanized after fabrication.

B. Cleaning:

1. Thoroughly clean metal surfaces of all mill scale, rust, dirt, grease, oil, moisture and other contaminants prior to galvanizing.
2. Remove by blast cleaning or other proven method surface contaminants and coatings.

C. Application:

1. Hot-dip galvanizing shall be applied in accordance with the following Reference Standards as a minimum:
   b. ASTM A153: Galvanized Coating on Iron and Steel Hardware – Table 1.
   c. ASTM A385: Practice for Providing High Quality Zinc Coatings.
   d. ASTM A143: Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel.
   e. Minimum weight of galvanized coating shall be 2-ounce per square foot of surface.

D. To minimize surface imperfection (e.g.: flux inclusions), material to be galvanized shall be dipped into a solution of Zinc Ammonium Chloride (preflux) and oven dried immediately prior to galvanizing. The type of galvanizing process utilizing a flux blanket overlaying the molten zinc will not be permitted.

E. After galvanizing, all materials not exposed to view must be chromated by dipping material in a 0.2 percent chromic acid solution.

F. Galvanized surfaces, where exposed to view, must have a smooth, level surface finish. Where this does not occur, piece shall be rejected and replaced to the acceptance of the Architect.
G. Source Quality Control for Galvanizing Work:

1. Galvanizer shall verify that units to be galvanized have been correctly fabricated for galvanizing.
2. Inspection and testing of hot-dip galvanized coatings shall be done under the American Hot-Dip Galvanizers Association (AGA) guideline publication "Inspection of Products Hot-Dip Galvanized after Fabrication" (T-IPAF).
3. Include visual examination and tests in accordance with ASTM A123 or A153, as applicable, to determine weight or mass of zinc coating per unit area of metal.

2.03 METALWORK FABRICATION REQUIREMENTS

A. General: Provide steel members as indicated on Drawings which comply with the requirements of referenced standards and which are free from surface blemishes where exposed to view in the finished product. Exposed-to-view surfaces exhibiting pitting, seam marks, roller mark, “oil canning,” stains, discoloration’s or other imperfections on finished units are not acceptable.

B. Make straight sections free of bow or camber. Make bends to constant radii without causing buckle, collapse or cracking. Abrupt or sharp bends or transitions will not be accepted.

C. Notch and weld intersections all around. Make turns and easements by radius bends without buckle, collapse, or cracking. Prefabricated, flush, weld-on fittings may be used instead of shop fabricated bends and intersections where they conform to required design and function and can be finished to match adjoining work.

D. Joints: Make flush, tight, butt joints where not otherwise shown/specified. Locate joints where least conspicuous. Construct joints to prevent water entry; provide concealed weepholes to drain internal condensation. Construct sleeved, sliding rail joints as necessary to accommodate thermal movement. Construct rigid, field joints with internal expansion couplings and concealed tamper-proof set screws. Weld other joints all around.

E. Closures: Close ends of rail exposed ends of other hollow members with welded flush plugs.

F. Weepholes: Provide 3/8-inch diameter holes in the bottom of fence, gate, guardrail and handrail to allow water to escape.

G. Shear and punch Work cleanly accurately. Remove burrs, barbs, splinters and sharpness; all edges and ends rolled, rounded, or capped.
H. Fit and trial assemble work in the shop. Permanently shop assemble work into the largest section that meet shipping and field conditions. Use connections that maintain structural value of joined pieces.

I. Welding: Follow AWS recommendations. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals. Obtain fusion without undercut or overlap. Remove welding flux immediately. Grind exposed welds smooth so that no roughness shows after finishing.

J. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AWS specifications.

K. Bolts and Fasteners: ASTM A307 and A325 of same basic metal and alloy as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or otherwise incompatible with metals joined.

L. Provide anchors, bolts, sockets, sleeves, and other parts required for securing each item of work to other construction. Furnish inserts and sleeves to be set into concrete formwork and concrete under Section 03 30 00, Cast-in-Place Concrete.

2.04 FENCES AND GATES

A. General: All materials shall be new, corrosion resisting “weathering steel,” conforming to ASTM A847, structural tubing.

1. Posts and Rails: Schedule 40 and Schedule 80 pipe, sizes as indicated on Drawings.
   a. Posts shall be of sufficient length to allow for installation into concrete footings to a minimum depth of 1 foot 6-inch below finish grade.

2. Plates, caps, tabs, and shapes shall be corrosion resisting “weathering steel” conforming to ASTM A588, Grade 50.

B. Bottom of all posts shall be hot dip galvanized subsequent to fabrication as indicated on Drawings and in accordance with ASTM A153 and A123.

1. Submit supplier’s certification that hot dip galvanizing conforms to ASTM standards cited.

2. Provide sample of hot dipped galvanized before applying to sample panel. After acceptance of sample, provide hot dipped galvanized on sample panel.
3. Preparation for Shop Prime: Clean galvanized steel in accordance with SSPC-SP1 Solvent Clean methods.

C. Fence Wire and Hardware: All fence wire; cables and associated hardware components shall be hot-dipped galvanized.

1. Fence wire shall be Class 3, Single Strand, 12.5 Gauge, Barbless Cable as manufactured by Keystone Steel and Wire Company, Peoria, IL (Telephone: (800) 447-6444), “or-equal.”

2. Hardware shall as manufactured by Stay-Tuff Fence MFG, Inc., New Barunfels, TX, “or-equal.” Hardware components shall be as follows:
   b. Crimp Sleeve: Model JM 593.

D. Metal Range Fence Gates:

1. Provide metal gate as detailed and at locations indicated on Drawings and in strict accordance with the approved Shop Drawings.

2. Hinges: Provide ball bearing J-bolt hinges as indicated on Drawings.
   a. 3/4-inch diameter by 10-inch ball bearing hinge as supplied by Kodiak Black, 1675 West Yale Avenue, Englewood, CO 80110 (Telephone: (303) 799-9757; Fax: (303) 799-9756), “or-equal.”

3. Gate Latches:
   a. Single and Double Gates: Provide weld-in spring loaded corral gate latch with 1/2-inch diameter spring loaded pin and handle as supplied by Washburn Farm & Home, 172 N.E. 1st LN, Lamar, MO 64759 (Telephone: (417) 682-5551), “or-equal.”
   b. Double Gates: Shall include a drop rod bar arranged to engage the gate stop. Locking device shall be constructed so that the drop rod cannot be raised when the gate is locked. The locking device shall have provisions for a padlock. All necessary fittings and gate holders to lock gates in both OPEN and CLOSED positions shall be furnished. The locking device shall be as manufactured by Boundary Fence Co., Inc., Jamaica, New York, or an approved equal locking device.

E. Gate Hardware: Provide metal gate hardware and chains as indicated on Drawings. All hardware shall be hot dip galvanized subsequent to fabrication as indicated on Drawings and in accordance with ASTM A153 and A123.
2.05 SNOW FENCE

A. Snow fencing shall consist of wood slats woven together with five two-wire strands of galvanized wire.

1. Materials:
   a. Slats shall be made of No. 1 aspen or spruce, 3/8-inch-thick, 1-1/2-inch-wide and 48-inch high. Both ends shall be cut square. The slats shall be natural wood (no paint).
   b. Wire shall be 13-gauge minimum galvanized steel.

2. Fabrication:
   a. The slats shall be spaced 2-1/4-inch apart (plus or minus 1/4 inch), with not less than two 360-degree twist of the wire in the weave between the slats.
   b. The fabric must be tightly woven so that the wire is forced into the wood slats sufficiently to hold them tightly.
   c. The strands of wire shall be spaced 10 inches apart and 4 inches from the ends of the slat.

B. Accessories:

1. Posts: Provide 6 feet long, galvanized steel T-posts, 1-7/16-inch by 1-5/16-inch by 1/8-inch, 1.25-pound per foot minimum.
2. Provide sufficient quantity of posts to space 8 feet OC typical.
3. Post clips: galvanized clips to secure snow fence to T-posts.

2.06 SERVICE GATES

A. General: Provide steel members as indicated on Drawings which comply with the requirements of referenced standards and which are free from surface blemishes where exposed to view in the finished product. Exposed-to-view surfaces exhibiting pitting, seam marks, roller mark, “oil canning,” stains, discoloration’s or other imperfections on finished units are not acceptable.

B. Steel Pile: ASTM A53, Schedule 40, Type S (seamless), Grade A for cold-bending.

1. Notch and weld intersections all around. Make turns and easements by radius bends without buckle, collapse, or cracking. Prefabricated, flush, weld-on fittings may be used instead of shop fabricated bends and intersections where they conform to required design and function and can be finished to match adjoining work.
2. Joints: Construct joints in exterior railings to prevent water entry; provide concealed weep holes to drain internal condensation. Construct sleeved, sliding rail joints as necessary to accommodate thermal
movement. Construct rigid, field joints with internal expansion couplings and concealed tamper-proof set screws. Weld other joints all around.

3. Closures: Close ends of rail exposed ends of other hollow members with welded flush plugs.

4. Weep Holes: Provide 3/8-inch diameter holes in the bottom of fence and gate to allow water to escape.

5. Bolts and Fasteners: ASTM A307 and A325 of same basic metal and alloy as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or otherwise incompatible with metals joined.

6. Posts shall be of sufficient length to allow for installation into concrete footings to a minimum depth below finish grade as indicated on Drawings.

7. Hinges: Provide extra strong, heavy-duty best quality hinges rated by the manufacturer for the weight and width of the supported gate panel. Hinges shall be intended by the manufacturer for exterior use.

PART 3 EXECUTION

3.01 EXAMINATION

A. Comply with Division 01, General Requirements.

B. The installer shall examine previous work, related work, and conditions under which this work is to be performed and notify the Contractor in writing of all deficiencies and conditions detrimental to the proper completion of this work.

C. Beginning work means installer accepts substrates, subgrades, previous work, and conditions.

3.02 INSTALLATION

A. The installer shall examine previous work, related work, and conditions under which this work is to be performed and notify the Contractor in writing of all deficiencies and conditions detrimental to the proper completion of this work. Beginning work means installer accepts substrates, subgrades, previous work, and conditions.

3.03 INSTALLATION AND ERECTION OF ALL FENCES

A. Pre-Installation Examination Required: The Installer shall examine previous work, related work and conditions under which this work is to be performed and notify Contractor in writing of all deficiencies and conditions detrimental to the proper completion of this work. Beginning work means Installer accepts substrate, previous work and conditions.
B. Manufacturer’s Instructions: Strictly comply with Manufacturer’s instructions and recommendations, except where more restrictive requirements are specified in this Section. Accurately locate fence as indicated on approved Shop Drawings and as field directed.

C. Install fence only after final grading is complete.

D. Install fence work, including fence over irregular terrain, with posts truly plumb and top of fence fabric and rails truly level to finish grade. Review layout of fence with the Landscape Architect prior to installation.

E. All work is to be performed in accordance with approved Shop Drawings as modified by field dimension. Anchorage shall be as shown on Drawings.

3.04 SNOW FENCE INSTALLATION

A. Snow fence shall be placed along the edges of all planted areas shown on Drawings, whether fences are indicated therein or not. The general alignment of the fences shall be as approved by the Landscape Architect in the field.

B. Install T-posts spaced every 8 feet OC (typical), except at ends where posts shall be spaced every 5 feet OC maximum.

C. Secure snow fence to T-posts using approved galvanized clips.

3.05 ADJUSTING

A. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

3.06 CLEAN-UP AND PROTECTION

A. Clean fences of all stains or marks and protect from damage. Replace any materials which are part of the final work that are broken or can not be cleaned to the satisfaction of the Landscape Architect.

B. After the fence work is installed, it shall be the responsibility of the Contractor to see that the fences and gates are properly and adequately protected from damage.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   f. A615/A615M, Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
   h. A824, Standard Specification for Metallic-Coated Steel Marcelled Tension Wire for Use with Chain Link Fence.
   i. A1011/A1011M, Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.
   l. C387, Standard Specifications for Packaged, Dry, Combined Materials for Mortar and Concrete.
   m. F552, Standard Terminology Relating to Chain Link Fencing.
   n. F567, Standard Practice for Installation of Chain-Link Fence.
   p. F668, Standard Specification for Polyvinyl Chloride (PVC) and Other Organic Polymer-Coated Steel Chain-Link Fence Fabric.

x. F1911, Standard Practice for Installation of Barbed Tape.

2. Institute of Electrical and Electronic Engineers (IEEE), Inc.: C2, National Electrical Safety Code.

3. National Electrical Manufacturers Association (NEMA): 250, Enclosures for Electrical Equipment (1,000 volts max.).

1.02 DEFINITIONS

A. Terms as defined in ASTM F552.

1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Product Data: Include construction details, material descriptions, dimensions of individual components, and finishes for chain link fences and gates.
      1) Fence, gate posts, rails, and fittings.
      2) Chain link fabric.
      3) Gates and hardware.
      4) Gate operators, motors, and mounting arrangements, switches, and controls; include operating instructions.
      5) Gate access system, including access control features, power and control wiring diagrams, and operating instructions.
      6) Accessories: Barbed wire.

2. Test Reports: Field test result for compliance of installation of chain link fence, gates, and gate operators.

B. Informational Submittals:

1. Manufacturer’s recommended installation instructions.

2. Evidence of Supplier and installer qualifications.
1.04 QUALITY ASSURANCE
   A. Erect fencing using skilled personnel experienced in chain link fence and gate construction.

1.05 DELIVERY, STORAGE, AND HANDLING
   A. Deliver materials to Site in undamaged condition. Store materials off the ground to provide protection against oxidation caused by ground contact.

1.06 SCHEDULING AND SEQUENCING
   A. Complete necessary Site preparation and grading before installing chain link fence and gates.

PART 2 PRODUCTS

2.01 GENERAL
   A. Match style, finish, and color of each fence component with that of other fence components.

2.02 CHAIN LINK FENCE FABRIC
   A. Provide 9-gauge (0.148 inch) wire woven into fabric in 2-inch mesh in accordance with AASHTO M181. Conform to Section 732.07 of ODOT Standard Specifications.
   B. Height: 72 inches, unless otherwise shown.
   C. Core Wire Gauge: No. 9.
   D. Pattern: 2 inch diamond-mesh.
   E. Diamond Count: Manufacturer’s standard and consistent for fabric furnished of same height.
   F. Loops of Knuckled Selvages: Closed or nearly closed with space not exceeding diameter of wire.
   G. Wires of Twisted Selvages:
      1. Twisted in a closed helix three full turns.
      2. Cut at an angle to provide sharp barbs that extend minimum 1/4 inch beyond twist.
2.03 POSTS

A. General:
   1. Conform to Section 732.06 of ODOT Standard Specifications.
   2. Wire Attachments: Conform to Section 732.06 of ODOT Standard Specifications; do not furnish posts with punched tabs for fastening wires to post by closing tab.

2.04 TOP AND BRACE RAILS

A. Galvanized Round Steel Pipe:
   1. Conform to Section 732.06 of ODOT Standard Specifications.

B. Protective Coatings: As specified for posts.

2.05 FENCE FITTINGS

A. General: Conform to Section 732.06 of ODOT Standard Specifications, excepts as modified by this article.

B. Post and Line Caps: Designed to accommodate passage of top rail through cap, where top rail required.

C. Tension Bars:
   1. One-piece.
   2. Length not less than 2 inches shorter than full height of chain link fabric.
   3. Provide one bar for each gate and end post, and two for each corner and pull post.

D. Truss Rod Assembly: 3/8-inch diameter, steel, hot-dip galvanized after threading rod and turnbuckle or other means of adjustment.

E. Barbed Wire Supporting Arms: Pressed steel or cast iron with clips, slots, or other means for attaching strands of barbed wire integral with post cap for each post, with single 45-degree arms for supporting three strands of barbed wire. Arms shall withstand 250 pounds of downward pull at outermost ends of the arms without failure.
2.06  TENSION WIRE

A.  Provide tension wire in accordance with AASHTO M 181, with a coating that matches the fence required by Contract.

2.07  BARBED WIRE

   1.  Line Wire: Two strands of No. 12-1/2-gauge.
   2.  Barbs:
      a.  Number of Points: Four.
      b.  Length: 3/8 inch minimum.
      c.  Shape: Round.
      d.  Diameter: No. 14-gauge.
      e.  Spacing: 5 inches.

2.08  GATES

A.  General:
   1.  Gate Operation: Opened and closed easily by one person.
   3.  Frames and Bracing: Fabricate members from round galvanized steel tubing with outside dimension and weight according to ASTM F900.
   4.  Gate leaves more than 8-feet wide shall have intermediate tubular members and diagonal truss rods to provide rigid construction, free from sag or twist.
   5.  Gate Fabric Height: Same as for adjacent fence height.
   7.  Chain Link Fabric: Attached securely to gate frame at intervals not exceeding 15 inches.
   8.  Gate Posts and Frame Members: Extend gateposts and frame end members above top of chain-link fabric at both ends of gate frame to attach barbed wire assemblies.
   9.  Latches: Arranged for padlocking so padlock will be accessible from both sides of gate.

B.  Swing Gates: Comply with ASTM F900 for double swing gate types.
   1.  Leaf Width: 72 inches.
2. Hinges: Offset type, malleable iron.
   a. Furnished with large bearing surfaces for clamping in position.
   b. Designed to swing either 180 degrees outward, 180 degrees inward, or 90 degrees in or out, as shown, and not twist or turn under action of gate.
3. Latches: Plunger bar arranged to engage stop, except single gates of openings less than 10 feet wide may each have forked latch.
4. Gate Stops: Mushroom type or flush plate with anchors, suitable for setting in concrete.
5. Locking Device and Padlock Eyes: Integral part of latch, requiring one padlock for locking both leaves of double gate.
6. Hold-Open Keepers: Designed to automatically engage gate leaf and hold it in open position until manually released.

2.09 CONCRETE

A. Provide as specified in Section 03 30 00, Cast-in-Place Concrete.

PART 3 EXECUTION

3.01 GENERAL

A. Install chain link fences and gates in accordance with ASTM F567, except as modified in this section, and in accordance with fence manufacturer’s recommendations, as approved by Engineer. Erect fencing in straight lines between angle points.

B. Provide necessary hardware for a complete fence and gate installation.

C. Any damage to galvanized surfaces, including welding, shall be repaired with paint containing zinc dust in accordance with ASTM A780.

D. Drainage Crossings: Where the chain-link fence must cross drainage ditches or swales, the main fence shall be carried across a ditch or swale with additional fence added below.

1. Frames and Bracing: The fence added below shall be fabricated with galvanized round steel pipe conforming to the requirements for top and brace rails.
2. The construction of the frame shall be welded or assembled with corner fittings. The frame shall be rigid and to the extent necessary to maintain a 2-inch clearance between bottom of the frame and finish grade. If necessary to maintain rigidity, attach to the frame a series of 3/8-inch
diameter galvanized steel pipe stakes that are embedded a minimum of 2 feet to the sides and bottom of the ditch.

3. Attach chain link fabric securely to frame at intervals not exceeding 12 inches.

3.02 PREPARATION

A. Clear area on either side of fence to the extent specified in Section 31 10 00, Site Clearing. Eliminate ground surface irregularities along fence line to the extent necessary to maintain a 2-inch clearance between bottom of fabric and finish grade.

B. Stake locations of fence lines, gates, and terminal posts. Do not exceed intervals of 500 feet or line of sight between stakes. Indicate locations of utilities, lawn sprinkler system, underground structures, benchmarks, and property monuments.

3.03 POST SETTING

A. Drill or hand-excavate holes for posts to diameters and spacing indicated, in firm, undisturbed soil. Driven posts are not acceptable. Postholes shall be clear of loose materials. Waste materials from postholes shall be removed from Site or regraded into slopes on Site.

B. Posthole Depth:

1. Minimum 3 feet below finished grade.
2. 2 inches deeper than post embedment depth below finish grade.

C. Set posts with minimum embedment below finished grade of 34 inches and with top rail at proper height above finished grade. Verify posts are set plumb, aligned, and at correct height and spacing. Brace posts, as necessary, to maintain correct position and plumbness until concrete sets.

D. Backfill postholes with concrete to 2 inches above finished grade. Vibrate or tamp concrete for consolidation. Protect above ground portion of posts from concrete splatter.

E. Before concrete sets, crown and finish top of concrete to readily shed water.

F. Terminal Posts: Locate terminal end, corner, and gate posts per ASTM F567 and terminal pull posts at changes in horizontal or vertical alignment of 15 degrees or more.

G. Line Posts: Space line posts uniformly at 10 feet on centers between terminal end, corner, and gate posts.
3.04 POST BRACING

A. Install according to ASTM F567, maintaining plumb position, and alignment of fencing. Install braces at gate, end, pull, and corner posts diagonally to adjacent line posts to ensure stability. Install braces on both sides of corner and pull posts.

1. Locate horizontal braces at mid-height of fabric or higher, on fences with top rail, and 2/3-fabric height on fences without top rail. Install so posts are plumb when diagonal truss rod assembly is under proper tension.

3.05 TOP RAILS

A. Install according to ASTM F567, maintaining plumb position and alignment of fencing. Run rail continuously through line post caps and terminating into rail end attached to posts or posts caps fabricated to receive rail at terminal posts. Install top rail sleeves with springs at 105 feet maximum spacing to permit expansion in rail.

3.06 BARBED WIRE SUPPORTING ARMS

A. Barbed wire supporting arms shall be installed as indicated and as recommended by manufacturer. Bolt or rivet supporting arm to top of post in a manner to prevent easy removal with hand tools. Angle single arms to outside of fence.

3.07 TENSION WIRE

A. Install according to ASTM F567 and ASTM F1916, maintaining plumb position and alignment of fencing. Pull wire taut, without sags. Fasten fabric to tension wire with tie wires at a maximum spacing of 24 inches on center.

B. Install tension wire within 6 inches of bottom of fabric and tie to each post with not less than same diameter and type of wire.

3.08 CHAIN LINK FABRIC

A. Do not install fabric until concrete has cured minimum 7 days.

C. Splicing shall be accomplished according to ASTM F1916 by weaving a single picket into the ends of the rolls to be joined.

D. Leave 2 inches between finish grade or surface and bottom selvage, unless otherwise indicated.

E. Tension or Stretcher Bars: Thread through fabric and secure to end, corner, pull, and gate posts with tension bands spaced not more than 15 inches on center.

F. Tie Wires: Fasten ties to wrap a full 360 degrees around rail or post and a minimum of one complete diamond of fabric. Twist ends of tie wire three full twists, and cut off protruding ends to preclude untwisting by hand.

   1. Maximum Spacing: Tie fabric to line posts at 12 inches on center and to brace and top rails at 24 inches on center.

3.09 BARBED WIRE

A. Install barbed wire uniformly in configurations of three strands of barbed wire on supporting arms. Pull wire taut and install securely to supporting arms and secure to end terminal post or terminal arms.

3.10 GATES

A. Install gates according to manufacturer’s written instructions, level, plumb and secure for full opening without interference. Attach fabric and hardware to gate using tamper-resistant or concealed means. Adjust hardware for smooth operation and lubricate where necessary so gates operate satisfactorily from open or closed position.

B. Set gate stops in concrete to engage center drop rod or plunger bar.

3.11 FIELD QUALITY CONTROL

B. Gate Tests:

   1. Prior to acceptance of installed gates, demonstrate proper operation of gates under each possible open and close condition specified.

   2. Adjust gate to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, misalignment, misplacement, disruption, or malfunction, throughout entire operational range.
3. Confirm that latches and locks engage accurately and securely without forcing and binding.

3.12 MANUFACTURER’S SERVICES

A. Provide manufacturer’s representative at Site in accordance with Section 01 43 33, Manufacturers’ Field Services, to train Owner’s personnel to adjust, operate, and maintain gates.

3.13 CLEANUP

A. Remove excess fencing materials and other debris from Site.

END OF SECTION
PART 1   GENERAL

1.01 GENERAL REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01, General Requirements Specifications, apply to this Section.

B. Coordinate work of this Section with other underground utilities and with trades responsible for their installation. Refer to respective Drawings pertaining to other work.

C. All references in this Section to “Contractor” and/or “Irrigation Contractor” shall mean “Landscape Contractor or Irrigation Contractor”.

D. Carefully examine all of the Contract Documents for requirements that affect the Work of this Section.

1.02 WORK DESCRIPTION

A. The work under this Section consists of furnishing adequate numbers of skilled workmen who are thoroughly trained and experienced and installing all materials, equipment and services required to complete and provide a fully operational, automatic landscape irrigation system for the landscape areas depicted on the final approved landscape plans.

B. The system shall automatically irrigate, using spray or stream rotary sprinklers as needed, on all meadow grass areas as indicated on the landscape plan and as directed by the Owner.

1. The primary source of irrigation water is an irrigation water meter provided by other trades and is not included in the irrigation scope of work.

2. Install Irrigation Controller at location determined by Owner.

3. Trench excavation, back filling and bedding materials, together with the testing and proper scheduling of the completed installation shall be included as part of this scope of work.

4. The work shall be constructed and finished in every respect in a good, workmanlike and substantial manner, to the full intent and meaning of the Specifications. All parts necessary for the proper and complete execution of the work, whether the same may have been specifically mentioned or not, shall be done or furnished in a manner corresponding
with the rest of the work as if the same were specifically herein described.

5. Record Drawing (As-built) as well as generation of the Operating and Maintenance Manual in accordance to these specifications shall also be included in this work.

C. At the completion of work, Contractor shall perform and successfully complete the tests as outlined in Article System Testing, Start-Up, and Adjustment.

1.03 PERMITS AND INSPECTIONS

A. The work under this Section shall comply with all ordinances and regulations of authorities having jurisdiction.

B. Obtain and pay for all permits to any agency having jurisdiction over the work required for the execution of this Section.

C. Furnish copies of Permits and Approval Notices to the Owner's Representative before requesting final payment.

D. The Contractor shall include in their bid any charges by the Water Department, Utility Company, or other authorities for work done by them and charged to the Contractor.

1.04 SUBMITTALS

A. General: Submit each item in this Article according to the Conditions of the Contract and Division 01, General Requirements Specification Sections.

B. The Contractor shall provide copies of product specification sheets on all proposed equipment to be installed to the Owner's Representative for approval prior to the start of work, in accordance with the parameters of Division 01, General Requirements. Work on the irrigation system may not commence until product sheets are submitted and approved. Submittals shall be highlighted to show proper model, nozzles, sizes, flows, etc. Submittals not properly highlighted or marked up will be rejected. As a minimum, the following equipment shall be included in the submittal:

1. Sprinkler heads.
3. Controllers and remote operators.
4. Valve boxes and enclosures.
5. Washed round river rock for valve enclosure sumps.
6. Pipe and fittings.
7. Wire and connectors.
8. Quick coupling valves.
10. Miscellaneous materials.

1.05 QUALITY ASSURANCE

A. Irrigation Contractor: A firm which has at least 5 years of experience in work of the type and size required by this Section and which is acceptable to the Owner’s Representative.

B. References: The Installation Contractor must supply three references for work of this type and size with their bid including names, phone numbers and email addresses of contact person(s).

C. Applicable requirements of accepted Standards and Codes shall apply to the Work of this Section and shall be so labeled or listed:

5. American Society of Agricultural Engineers (ASAE).
6. Underwriters Laboratories, Inc. (UL).
7. Occupational Safety and Health Regulations (OSHA).

1.06 DELIVERY, STORAGE AND HANDLING

A. Store and handle all materials in compliance with manufacturer instructions and recommendations. Protect from all possible damage. Minimize on-site storage. Contractor is responsible for the security of all stored materials on site.

1.07 GUARANTEE

A. The Contractor shall obtain in the Owner's name the standard written manufacturer's guarantee of all materials furnished under this Section where such guarantees are offered in the manufacturer's published product data. All these guarantees shall be in addition to, and not in lieu of, other liabilities that the Contractor may have by law.

B. In addition to the manufacturers guarantees the Contractor shall warrant the entire irrigation system, both parts and labor for a period of 1 year from the date of acceptance by the Owner.
C. As part of the 1-year warranty the Contractor shall perform the first year-end winterization and spring start-up for the irrigation system.

D. Should any problems develop within the warranty period because of inferior or faulty materials or workmanship, they shall be corrected to the satisfaction of the Owner’s Representative at no additional expense to the Owner.

E. A written warranty showing date of completion and period of warranty shall be supplied upon completion of each segment of the Project.

1.08 COORDINATION

A. The Contractor shall at all times coordinate their work closely with the Owner’s Representative to avoid misunderstandings and to efficiently bring the Project to completion. The Irrigation Contractor shall also coordinate their work with that of the electrical contractor, general contractor, plumbing contractor and landscape contractor. The Owner’s Representative shall be notified as to the start of work, progression and completion, as well as any changes to Drawings before the change is made. The Contractor shall also coordinate their work with that of their subcontractors.

B. The Contractor shall be held responsible for and shall pay for all damage to other work caused by their work, workmen or subcontractors. Repairing of such damage shall be done by the Contractor who installed the work as directed by the Owner’s Representative.

1.09 MAINTENANCE AND OPERATING INSTRUCTIONS

A. Contractor shall include in their Bid an allowance for 8 hours of instruction of Owner and/or Owner's personnel upon completion of check/test/start-up/adjust operations by a competent operator (The Owner’s Representative office shall be notified at least 1 week in advance of system testing, start-up and adjustment.

B. Upon completion of work and prior to application for acceptance and final payment, a minimum quantity of 3-ring, hard cover binders titled MAINTENANCE AND OPERATING INSTRUCTIONS FOR THE ZINK DAM IMPROVEMENTS IRRIGATION SYSTEM, shall be submitted to the Owner’s Representative office. After review and approval, the copies will be forwarded to the Owner. Included in the Maintenance and Operating binders shall be:

1. Table of Contents.
2. Written description of Irrigation System.
3. System Drawings:
   a. One copy of the approved irrigation plan.
b. One copy of the Record Drawing (As-Built); Measurements on Record Drawings shall be surveyed or triangulated from permanent objects and recorded on Autocad compatible digital format.

c. One reproducible of the Record Drawing.

d. An Autocad compatible digital file of the record drawing.

4. A complete set of "Approved" submittals of all irrigation equipment;

5. A copy of the suggested "System Operating Schedule" which shall call out the controller program required (zone run time in minutes per day and days per week) in order to provide the desired amount of water to each area under "no-rain" conditions.

6. One copy of the controller/valve/rain/moisture/flow sensor system wiring diagram.

1.10 EXAMINATION OF CONDITIONS

A. The Contractor shall fully inform himself of existing conditions on the site before submitting their bid, and shall be fully responsible for carrying out all work required to fully and properly execute the work of the Contract, regardless of the conditions encountered in the actual work. No claim for extra compensation or extension of time will be allowed on account of actual conditions inconsistent with those assumed, except those conditions described in the General Conditions.

1.11 PROCEDURE

A. Notify all city departments and/or public utility owners concerned, of the time and location of any work that may affect them. Cooperate and coordinate with them in the protection and/or repairs of any utilities.

B. Provide and install temporary support, adequate protection and maintenance of all structures, drains, sewers, and other obstructions encountered. Where grade or alignment is obstructed, the obstruction shall be permanently supported, relocated, removed or reconstructed as directed by the Architect.

PART 2 PRODUCTS

2.01 GENERAL

A. All materials to be incorporated in this system shall be new and without flaws or defects and of quality and performance as specified and meeting the requirements of the system. All material overages at the completion of the installation are the property of the Contractor and shall be removed from the site.
ZINK DAM IMPROVEMENTS

2.02 PVC IRRIGATION PIPE AND FITTINGS

A. All pipe shall bear the following markings: Manufacturer’s name, nominal pipe size, schedule or class, pressure rating in psi, and date of extrusion.

B. All lateral pipe 3/4-inch and larger shall be PVC, Class 200 Type 1120, SDR 21, solvent-weld PVC. Lateral pipe shall conform to ASTM D2241 as manufactured by PipeLife Jet Stream, or approved equal.

C. All main line pipe shall be PVC, Schedule 40, Type 1120, solvent-weld PVC, conforming to ASTM D1784. Pipe shall be as manufactured by PipeLife Jet Stream, or approved equal.

D. Fittings for solvent weld PVC pipe shall be Schedule 40 solvent weld PVC fittings as manufactured by Dura, Lasco, Spears, or approved equal.

E. Fittings shall bear manufacturer’s name or trademark, material designation, size, and applicable I.P.S. schedule.

F. PVC Schedule 80 fittings and nipples shall be used on all fittings required between the mainline and the electric control valve as well as the threaded connection between the electric control valve and the lateral piping. Schedule 80 fittings shall be Spears Manufacturing or approved equal. Contractor shall use Teflon tape or other sealing method according to valve, sprinkler and fitting manufacturer’s recommended practice for the specific application. All Schedule 80 PVC nipples shall be supplied with machined threads.

G. PVC solvent shall be NSF approved, for Type I and Type II PVC pipe, and Schedule 40 and 80 fittings. Cement is to meet ASTM D2564 and FF493 for potable water pipes. PVC solvent cement shall be Rectorseal Gold, IPS Weld-ON 711, Oatey Medium Cement or equal, and shall be used in conjunction with the appropriate primer. Primer shall be NSF approved, and formulated for PVC and CPVC pipe applications. Primer is to meet ASTM F656. Primer shall be Rectorseal Jim PR-2, IPS Weld-ON P-68 Clear, Oatey Purple Primer for PVC and CPVC, or approved equal.

2.03 PIPE SLEEVES

A. All pipe sleeves beneath nonsoil areas (with the exception of City of Tulsa streets) shall be PVC, Schedule 40 water pipe as manufactured by PipeLife Jet Stream, or approved equal. Sleeves shall be two times larger than the total

LANDSCAPE IRRIGATION

PW\DEN003\696780

32 84 00 - 6

MARCH 2020

©COPYRIGHT 2020 CH2M HILL
outside diameter of all the piping contained within the sleeve. All irrigation control wire shall be routed in a separate 2-inch minimum diameter sleeve.

B. Minimum pipe sleeve size shall be 4-inch diameter.

2.04 WIRE CONDUIT

A. Conduit for wiring beneath non-soil areas shall be PVC, Schedule 40 conduit with solvent-weld joints, as manufactured by Certainteed, Cresline, or approved equal.

B. Sweep ells shall be standard electrical type PVC Schedule 40 long sweep elbows. Cap sweep ell with tri-plug with the ring for securing nylon pull rope.

C. Conduit for above ground wiring to environmental sensors, weather stations or controllers shall be galvanized, rigid metallic conduit.

2.05 SPRAY SPRINKLERS

A. Full and part circle pop up spray sprinklers shall be pressure regulating at 45 psi, plastic construction with ratcheting riser, removable nozzle and check valve. Nozzle size shall be as indicated on the drawing and in the legend. Pop-up height shall be 12-inch for meadow grasses. The sprinkler shall have 1/2-inch IPS water connection on the bottom and side of the sprinkler.

B. Nozzle size shall be as required to provide adequate coverage and avoid over spray onto walkways, roads, buildings and other permanent structures.

C. Sprinkler shall carry a minimum 5-year exchange warranty against defects. Sprinklers shall be manufactured by Rain Bird, Model 1800-SAM-P45, or approved equal.

2.06 BACKFLOW PREVENTER

A. Provide backflow preventer meeting the requirements of the City of Tulsa, OK for irrigation systems equal to Wilkins Model 975XLSE–1.5-inch, or approved equal. The 1-1/2-inch backflow preventer shall be installed using Type L copper pipe and shall incorporate two unions for ease of installation and maintenance.

B. The backflow preventer shall be protected from freeze damage by covering it with an insulated cover and using thermostatically controlled "heat tape" or heaters. The insulated box shall be constructed of fiberglass, hinged to provide full access to the preventer. The enclosure shall be designed to accommodate the heat tape, for the recommended drain size and for the size of the backflow
preventer to be installed. Enclosure shall be Hubbell Model HB1.5, or approved equal.

C. The backflow preventer protective enclosure shall be installed on a concrete footing constructed of a minimum 3,500 psi concrete and shall meet the requirements of the backflow preventer cover manufacturer’s recommendation for size and mounting requirements including hardware. Contractor shall reference installation detail drawings for details of the base. The ground shall be hand excavated to provide a solid surface for the concrete foundation. The surface of the concrete base must be finished level to insure proper installation of the cover.

2.07 ELECTRIC CONTROL VALVES

A. Electric control valves shall be remote control diaphragm type glass-filled nylon body valves with flow control and 200 psi pressure rating. Valve shall have globe configuration, 24-volt electric. Valve shall have a self-cleaning stainless steel screen designed for use in dirty water applications.

B. Valves shall be manufactured by Rain Bird Model PEB or approved equal.

2.08 AUTOMATIC DRAIN VALVES

A. Automatic drain valves shall be Model 22163 (1/2-inch) or 22167 (3/4-inch) as manufactured by King Innovation, Inc. At least four drains per piping zone shall be installed at the points of lowest elevation to permit proper drainage in areas susceptible to freezing.

2.09 QUICK CouPLING VALVES

A. Quick Coupling Valves and Keys: Valve equal to Rain Bird Model 44-NP, two-piece, 1-inch single lug, and lavender colored locking vinyl cover. The valve body shall be of cast brass construction with a working pressure range of 5 psi to 125 psi. The valve seat disc plunger body shall be spring loaded so that the valve is normally closed under all conditions when the key is not inserted. Quick coupling valve shall be prevented from rotation with a Leemco Model LS-120 valve stabilizer.

B. The valve body construction shall be such that the coupler seal washer may be removed from the top for cleaning or replacement without disassembling any other parts of the valve. The quick coupling valve shall be equipped with a purple colored vinyl cover with "Do Not Drink" warnings in English and Spanish.
C. Keys shall be 1-inch male thread and 3/4-inch female thread at the top equal to Rain Bird Model 44-K, or approved equal. Provide two quick coupler keys to Owner at project completion.

D. Hose swivels shall be 1-inch FPT by 1-inch MHT, Rain Bird Model SH-2, or approved equal. Provide two hose swivels to Owner at project completion.

2.10 ISOLATION VALVES

A. Line isolation valves 2 inches and smaller in size and main line drain valves shall be gate type, of bronze construction, US Manufacture, 200 WOG with steel cross handle and 200 psi rating. Gate valves to be as manufactured by Nibco, Model T-113-K, or approved equal.

B. Electric Control Valve Isolation Valves: 2-inch and smaller shall be of the ball type, plastic construction, tru-union threaded ends and have a maximum pressure rating of 235 psi at 73 degrees F. The valves shall be equal to Spears Model 3629-XX size the same as the control valve, or approved equal.

2.11 VALVE BOXES

A. All valve boxes and covers shall be injection molded of structural foam polyethylene with a melt index between 10 and 12 and shall be UV stabilized. All boxes and covers shall be green in color.

B. Valve box extensions shall be provided and installed as required for proper box depth. Valve box extensions shall be made by the same manufacturer.

C. Valve boxes for isolation valves, quick coupling valves, drip air release and isolation valves and in-line check valve locations shall be 10-inch round valve boxes with bolt down covers equal to Carson Industries, Inc., Model 910-12 or Rain Bird Model VB10RNDH with 8-inch I.D. corrugated polyethylene pipe, as manufactured by Advanced Drainage Systems, Inc. (ADS), cut to length as required for extensions.

D. Valve boxes for automatic electric control valves (non drip zones) and master control valves shall be 13-inch by 20-inch ("jumbo") valve boxes with bolt down covers equal to Carson Industries Inc., Model 1220-12 with Model 1220E-1 6-inch extensions or Rain Bird Model VBJMBH with Model VBJMB6EXTB 6-inch extensions.

E. Valve boxes for automatic electric control valves (drip zones) shall be 13-inch by 20-inch ("jumbo") valve boxes with bolt down covers equal to Carson Industries Inc., Model 1220-12 with Model 1220E-1 6-inch extensions or Rain Bird Model VBJMBH with Model VBJMB6EXTB 6-inch extensions.
F. Valve boxes for wire splices shall be 10-inch round valve boxes with bolt down covers equal to Carson Industries, Inc., Model 910-12 or Rain Bird Model VB10RNDH with 8-inch I.D. corrugated polyethylene pipe, as manufactured by Advanced Drainage Systems, Inc. (ADS), cut to length as required for extensions. All splices shall be in separate valve boxes and not included with isolation valves.

2.12 AUTOMATIC CONTROLLER AND SENSORS

A. The controllers shall be of a hybrid type that combines electro-mechanical and microelectronic circuitry capable of fully automatic or manual operation. The controller shall be housed in a wall-mountable, weather-resistant plastic cabinet with a key-locking cabinet door suitable for either indoor or outdoor installation. The controller shall have a base station capacity of eight or 12 stations as well as three expansion slots capable of receiving station modules of four, eight, or 12 stations to create a controller capacity of up to 48 stations. All stations shall have the capability of independently obeying or ignoring the weather sensor as well as using or not using the master valve. Station timing shall be from 0 minutes to 12 hours. The controller shall have a Seasonal Adjustment by program which adjusts the station run time from 0 to 300 percent in 1 percent increments. The controller shall also have a Monthly Seasonal Adjustment of 0 percent to 300 percent by month. Station timing with Seasonal Adjustment shall be from 1 second to 16 hours. The controller shall have four separate and independent programs which can have different start times, start day cycles, and station run times. Each program shall have up to eight start times per day for a total of 32 possible start times per day. The four programs shall be allowed to overlap operation based on user defined settings which control the number of simultaneous stations per program and total for the controller. The controller shall allow up to five valves to operate simultaneously per program and total for the controller including the master valve/pump start circuit. The controller shall have an electronic, diagnostic circuit breaker that shall sense a station with an electrical overload or short circuit and shall bypass that station and continue to operate all other stations. The controller shall have a 365-day calendar with Permanent Day Off feature that allows a day(s) of the week to be turned off on any user selected program day cycle. (Custom, Even, Odd, Odd31, and Cyclical). Days set to Permanent Day Off shall override the normal repeating schedule and not water on the specified day(s) of the week. The controller shall also have a Calendar Day Off feature allowing the user to select up to five dates up to 365 days in the future when the controller shall not start programs. The controller shall incorporate a Rain Delay feature allowing the user to set the number of days the controller should remain off before automatically returning to the auto mode. The controller shall have Cycle+Soak water management software which is capable of operating each station for a maximum cycle time and a minimum soak time to reduce water run-off. The maximum cycle time shall
not extended by Seasonal Adjustment. The controller shall incorporate a FloManager feature providing real-time flow, power, and station management. FloManager shall manage the number of stations operating at any point in time based on water source capacity, station flow rate, number of valves per station; user-defined simultaneous stations per program and for the controller. FloManager shall incorporate the ability to provide station priorities to determine the order in which stations shall operate. The controller shall ignore the station number and instead operate the highest priority stations first and the lower priority stations last when FloManager is enabled. FloManager shall be an option that is disabled by default and the controller shall operate zones in order of station number, started with the lowest numbered zone set to irrigate and ending with the highest number zone. The controller shall offer Water Windows for each program. This function sets the allowed start and stop time where watering is allowed. If the watering cannot be completed by the time the Water Window closes, the stations with remaining run time are paused and watering automatically resumes when the Water Window opens the next time. The controller shall have an alarm indicator light on the front panel visible through the outer door with the door closed and locked. The alarm light shall prompt the user to select the alarm soft key to review the alarm condition(s). The controller shall be supplied with the optional stainless steel metal cabinet, Rain Bird Model LXMMSS. The controller shall be Model ESP-LXME as manufactured by Rain Bird Corporation, or approved equal.

B. The rain sensor shall shut off the irrigation system when the measured rainfall equals or exceeds the shutoff setting of the sensor device. The freeze sensor shall be adjustable between 33 degrees F and 41 degrees F and shall shut off the irrigation system when the temperature reaches at or below the set point. The device shall be adjustable with positive stops from 1/8-inch to 1/2-inch. Sensor shall have quick shut-off capability to suspend irrigation during a rain event. The device shall be UL rated, maintenance free and shall absorb water and shall dry out at rates similar to turf. The device shall have a self-leveling bracket which can be mounted to flat surfaces or rain gutters. Sensor shall be installed within 700 feet line-of-sight between sensor and irrigation controller. The wireless device shall be manufactured by Rain Bird Mfg, Model WR2RFC, or approved equal.

2.13 WIRE

A. Single Conductor Wire for direct burial applications, meeting UL Standard 493, UF-14/1 for "Control" wiring and UF-14/1 for "Common" wiring. Color code the common neutral wiring from all other wires.
B. In ground wire connections shall be UL listed, rated for 600 volts manufactured by Rain Bird Model WC20, or approved equal. All wire connections shall be made in specified valve boxes.

C. Wire type and method of installation shall be in accordance with local codes for NEC Class II circuits of 30V ac or less.

2.14 SWING JOINTS

A. All 1/2-inch inlet spray heads shall be connected to the irrigation piping utilizing 1/2-inch-thick walled polyethylene tubing (Rain Bird Model SPX-FLEX100) and appropriate insert fittings (Rain Bird Models SBE-050, SBE-075, SBA-050, SBA-075). Sufficient lengths of flexible pipe shall be used to form a sweeping arc to ensure that spray heads are supported properly and allow for vertical adjustment and movement during service.

B. Swing Joints: All 1-inch inlet quick coupling valves shall be installed on prefabricated, manufactured swing joint assembly rated for 315 psi with prelubricated buttress threads and O-ring seals equal to Spears Manufacturing Co. Series 5807-01012, or approved equal.

2.15 GROUNDING EQUIPMENT

A. The irrigation controller shall be grounded to the manufacturer's recommended resistance to ground.

B. Proper grounding practices shall include both the installation of ground rods and grounding plates. Ground rods shall be copper clad, 5/8-inch diameter by 10-foot long grounding rods and connected to the electrical equipment and grounding plate with minimum #6 AWG, solid, bare copper wire. Grounding plates shall be 4-inch by 96-inch by 0.0625-inch copper as outlined below. Minimum 20-foot separation between rod and plate. Minimum 12-foot separation between controller and ground rod. All connections to rods shall be with Cadweld connectors as specified. All connections to plates shall be performed by the plate manufacturer with 25 feet of bare copper wire already attached. Each grounding rod is to be covered by a 4-inch round, grater top, plastic valve cover and six inches of 4-inch SDR35 PVC. Plates shall be installed in ground enhancement material. Plates shall be covered with 4-inch plastic grater cover with detection and minimum 36 inches of 4-inch ADS drainage pipe. Ground rods and plates shall be UL listed.

2.16 SAND

A. Sand used for backfilling of trenches; under, around and over PVC lines shall be as specified in Section 31 23 23, Fill and Backfill.
2.17 CONCRETE BASES

A. All concrete bases shall be standard concrete mix. Sizes shall be as indicated on Drawings and cited in the Specifications.

2.18 SPARE PARTS

A. Contractor shall supply the following tools and equipment to the Owner’s Representative before final observation:

1. Two wrenches for disassembling and adjusting each type of sprinkler head provided.
2. Two quick coupler keys and hose swivels.
3. Four of each type sprinkler head and pattern (PC and FC) used in the Project.
4. Four of each type nozzle used in the Project.
5. Four diaphragms and solenoids for each type and size of control valve used in the Project.

B. Before final observation can occur, written evidence that the Owner’s Representative has received the tools and equipment must be shown to the Owner.

PART 3 EXECUTION

3.01 GENERAL

A. Before work is commenced, hold a conference with the Owner’s Representative to discuss general details of the work.

B. Examine all contract documents applying to this Section noting any discrepancies and bringing the same to the attention of the Owner’s Representative for timely resolution.

C. Verify dimensions and grades at job site before work is commenced. Do not proceed with installation of the landscape irrigation system when it is apparent that obstructions or grade differences exist or if conflicts in construction details, irrigation equipment legend or specific notes are discovered. All such obstructions, conflicts, or discrepancies shall be brought to the attention of the Owner’s Representative.

D. Make all field measurements necessary for the work noting the relationship of the irrigation work to the other trades. Coordinate with other trades (landscaping and other site work trades). Project shall be laid out essentially as indicated on the Irrigation Plans, making minor adjustments for variations.
in the planting arrangement. Major changes shall be reviewed with the Owner’s Representative prior to proceeding.

E. Coordinate installation of all sprinkler materials, including pipe, to avoid conflict with the trees, shrubs, or other plantings. Special attention shall be made to avoid damage to the root system of existing trees. Contractor shall contact Owner’s Representative for guidance on trenching in this area.

F. During progress of work, a competent superintendent and all assistants necessary shall be on site. All shall be satisfactory to the Owner’s Representative. The superintendent shall not be changed, except with the consent of the Owner’s Representative, unless that person proves unsatisfactory and ceases to be employed. The superintendent shall represent the Contractor in the Contractor’s absence and all directions given to the superintendent shall be as binding as if given to the Contractor.

G. At all times, protect existing irrigation, landscaping, paving, structures, walls, footings, etc. from damage. Any inadvertent damage to the work of another trade shall be reported at once.

H. Replace, or repair to the satisfaction of the Owner, all existing paving disturbed during course of work. New paving shall be the same type, strength, texture, finish, and be equal in every way to removed paving.

3.02 PIPE AND FITTINGS INSTALLATION

A. Using proper width trencher chain, excavate trenches to a depth of minimum pipe coverage plus 6 inches. Trenches shall have sides as nearly vertical as possible. Remove all lumber, rubbish and rocks larger than 1 inch from the trenches. Provide a uniform bearing for the entire length of each pipe line to prevent uneven settlement. Wedging or blocking of pipe will not be permitted. Make the width of the trench a minimum of 1-1/2 times the diameter of the piping but not less than 4 inches.

B. Loam or topsoil encountered within the limits of trench excavation for irrigation mains and branch lines shall be carefully removed to the lines and depths as shown on Drawings and stockpiled for subsequent replacement in the upper 6 inches of the trench from which it is excavated. Such removal and replacement of the quantities of loam shall be considered incidental to the irrigation system and no additional compensation will be allowed therefore.

C. Back filling shall be accomplished as follows:

1. The first 10-inch of backfill material shall contain no foreign matter and no rock larger than 1-inch in diameter. Carefully place material around pipe and wire and tamp in place. Remainder of backfill shall be laid-up
in 6-inch (maximum) lifts and tamped to compaction with mechanical equipment. Compaction in paved areas shall be to 98 percent standard proctor. Compact backfill in trenches to dry density equal to the adjacent undisturbed soil, and conform to adjacent grades without dips, sunken area, humps, or other irregularities. Frozen material shall not be used for backfill.

D. Do backfilling when pipe is cool. During hot weather keep pipe cool by backfilling in the early part of the morning before the heat of the day.

E. Do not, under any circumstances, use truck wheels or flooding for compacting soil.

F. Restore grades and repair damage where settling occurs.

G. All solvent-weld joints shall be made in strict accordance with manufacturer's recommendations and ASTM D2855 Standard Practice. Make solvent welds with a nonsynthetic bristle brush in the following sequence:

1. Apply an even coat of solvent to the outside of the pipe. Then apply solvent to the inside of the fittings and then re-apply a light coat of solvent to the outside of the pipe, making sure that coated area on the pipe is equal to the depth of the fitting socket. Insert pipe quickly into the fitting and turn the pipe approximately 1/4 turn to distribute the solvent and remove air bubbles. Check all tees and ells for correct position, then hold joint for approximately 15 seconds so that pipe does not push out from the fitting. Wipe off any excess of primer or solvent from each connection. Allow at least 15-minute drying time for each weld joint before moving. When the temperature is above 80 degrees F, allow connections to set minimum 24 hours before pulling or pressure is applied to the system. When temperature is below 80 degrees F, follow manufacturer’s recommendations. Provide and install for expansion and contraction as recommended. Wire shall be laid in same trench as mainline and at pipe invert (see Article Wiring Installation).

H. The minimum cover over the pipe shall be as follows:

1. Mainline Pipe: 20 inches of cover over pipe.
2. Lateral Pipe: 15 inches of cover over pipe.

I. Cut plastic pipe with handsaw or pipe-cutting tool, removing all burrs at cut ends. All pipe cuts are to be square and true. Bevel cut end as required to conform to Manufacturer's Specifications.

J. Every precaution shall be taken to prevent foreign material from entering the pipe while it is being placed in the trench. At times, when installation of the
piping is not in progress, the open end(s) of the pipe shall be closed by a watertight plug or other means. All piping, which cannot temporarily be joined, shall be sealed to make as watertight as possible. This provision shall apply during the lunch hour as well as overnight. Pipe not to be installed that day shall not be laid out. Should water enter the trench during or after installation of the piping, no additional piping may be installed or back filled until all water is removed from the trench. Pipe shall not be installed when water is in the trench, when precipitation is occurring, or when the ambient temperature is at 40° F or below. Pipe installed at temperatures below 40° F shall be removed and replaced at no cost to the Owner. PVC pipe shall be snaked in the trench to accommodate for expansion and contraction due to changes in temperature.

K. Carefully install system in areas of existing vegetation designated to remain to provide minimal disturbance feasible. When trenching under the drip-line of existing trees, extreme care must be given to avoid root damage. If at all possible avoid trenching inside the drip-line by going around the tree rather than under it. If trenching must occur under the drip-line, use either tunneling or hand-digging methods rather than a mechanical trencher. Minimize the impact of root severing by avoiding construction during hot, dry weather, keeping trees well watered before and after digging and covering roots with soil or mulch as soon as possible. Contractor shall contact Owner’s Representative for guidance on trenching in this area. Where excavation must occur near trees, the Contractor shall provide proper root pruning and sealing methods shown in the landscape plans and specifications and approved by Owner’s Representative.

L. Maintain 6-inch minimum clearance between sprinkler lines and lines of other trades. Do not install sprinkler lines directly above another line of any kind.

M. Maintain 1-inch minimum clearance between lines which cross at angles of 45 degrees to 90 degrees.

N. Exercise care when excavating, trenching and working near existing utilities.

O. Throughout the guarantee period it will be the responsibility of the Contractor to refill any trenches that have settled due to incomplete compaction.

P. Pulling of pipe will be allowed provided soil is suitable and specified depth of bury can be maintained.

3.03 ELECTRICAL WIRE CONDUIT INSTALLATION

A. Electrical conduit shall be installed in all nonsoil areas, as well as for all above ground wiring where wire passes under or through walls, walks and paving to controllers and other sensors.
B. Conduit shall extend 18 inches beyond edges of walls and pavement.

3.04 PIPE SLEEVING INSTALLATION

A. Contractor is responsible for the supply and installation of sleeves whether shown on Drawings or not. Install sleeves under paving and other improvements prior to construction. Install where required to accommodate piping at proper depth to prevent damage by other construction activities and to provide specified burial depth for irrigation pipe. Location of sleeves to be recorded and marked.

B. Sleeving shall be installed wherever piping is going under a non-soil area, generally where indicated on Drawings. Cover over all sleeving pipe shall be appropriate for the specified depth of the pipe passing through the sleeve. Minimum coverage shall be 20 inches.

C. Sleeving shall extend 24 inches beyond edges of walls and pavement.

D. If finished pavement is in place, the Contractor shall bore under the pavement for sleeving installation using personnel experienced in the procedure. Contractor shall be responsible for all damage to finished paving due to improper boring.

3.05 ISOLATION VALVE INSTALLATION

A. Install isolation valves in 10-inch round valve boxes with extensions at locations shown on Irrigation Plan Drawings.

B. Install all isolation valves on a level crushed stone base so that they can be easily opened or closed with the appropriate valve wrench.

3.06 VALVE AND VALVE BOX INSTALLATION

A. Furnish and install a valve access box for each electric valve, quick coupling valve, isolation valve, wire splice, flushing valve, air/vacuum relief valve, inline check valves, etc.

B. Valves and valve boxes shall be installed where shown or directed, and shall be set plumb. Valve boxes shall be centered on the valves. Where feasible, valves shall be located outside the area of natural walkways or paths. Earth fill shall be carefully tamped around each valve box. Valve boxes should be supported by concrete blocks to ensure that any surface loads on the valve boxes will not be transmitted below to the pipe or valves. All boxes shall have at least 6-inch depth of clean washed round river rock under the valve boxes for drainage.
C. Electric control valves shall be set plumb with adjusting handle and all bolts, screws and wiring accessible through the valve box opening. Valves shall be set in a plumb position with 24-inch minimum maintenance clearance from other equipment. Adjust zone valve operation after installation using flow control device on valve.

3.07 WIRING INSTALLATION

A. Wiring shall be installed along with the main distribution line. Multiple wire bundles shall be cinched together at maximum 12-foot centers using plastic cable cinches and shall be laid beside, and at the same invert as, the irrigation lines. Sufficient slack for expansion and contraction shall be maintained and wiring shall at no point be installed tightly. Provide and install an additional 8 inches to 12 inches slack at all changes of direction. Wiring in valve boxes shall be a sufficient length to allow the decoder, valve solenoid, splice, and all connections to be brought above grade for servicing. This additional slack shall be coiled for neatness in the valve box.

B. All wire shall be laid in trenches and shall be carefully back-filled to avoid any damage to the wire insulation or wire conductors themselves. In areas of unsuitable material, the trench shall have a 3-inch layer of sand or stone dust on the bottom before the wires are laid into the trench and back-filled. The wires shall have a minimum of 15 inches of cover. Wire not to be installed that day shall not be laid out.

C. An expansion curl shall be provided and installed within 6 inches of each wire connection to a solenoid. Expansion curls can be formed by wrapping five turns of wire around a 1-inch diameter or larger pipe and then withdrawing the pipe.

D. Service wiring in connection with Drawings and local codes for 24-volt service. All in-ground wire connections shall be waterproofed with materials specified in Part 2. All splices shall be made in valve boxes (wire runs requiring splices between valve locations shall be provided and installed in splice box-valve box shall be used). Splice locations shall be shown on the Record Drawings.

E. Contractor shall provide a complete wiring diagram showing wire routing for the connections between the central controller, sensors, valve decoders, sensor decoders and valves. See Part 1 for the inclusion of wiring diagram in operation and maintenance manuals.

3.08 CONTROLLER AND SENSORS INSTALLATION

A. Coordinate with the General Contractor the exact location where the automatic controller will be located. Connect all wiring and grounding in
accordance with manufacturer's instructions. Provide separate conduits for both power supply and control wiring.

B. Install the rain and freeze sensors in an open area where the device is exposed to rain water but not sprinkler water. Mount away from overhanging objects that may interfere with rainfall. Connect wiring in accordance with manufacturer's instructions.

3.09 SPRINKLER INSTALLATION

A. Spray sprinklers and rotary sprinklers shall be installed on flexible connections or swing joints as specified in Part 2 and shall be set plumb and level with the final grade and In accordance with manufacturer's recommendations. Locate part circle sprinklers to maintain a minimum of 4 inches from walls and 2 inches from other boundaries and borders.

3.10 QUICK COUPLING VALVE INSTALLATION

A. Provide quick coupling valves at locations shown on Drawings.

B. Quick coupling valves to be mounted on 1-inch inch PVC unitized swing joint with stabilizer.

3.11 GROUNDING INSTALLATION

A. Contractor shall ground all electrical equipment according to the irrigation manufacturer’s requirements and specifications. Each grounding rod shall be driven into the ground its full length within 8 feet of the controller and connected via a Cadweld connection to #6 solid, bare copper wire. The copper wire is to be installed in as straight a line as possible, and if it is necessary to make a turn or bend, it shall be done in a sweeping curve with a minimum radius of 8 inches and a minimum included angle of 90 degrees. There shall be no splices in the bare copper wire. The top of the ground rod shall be driven below the ground surface. A 4-inch grated cover as specified, set a minimum of 1-inch below grade, shall be placed over the ground rod and Cadweld connection for periodic maintenance. Cover shall be installed on a minimum of 6 inches of 4-inch SDR35 PVC drainage pipe. Plates shall be installed 36 inches below grade with 50 pounds of ground enhancement material spread evenly below the plate in accordance with the manufacturer’s requirements.

B. Grounding rods shall be separated a minimum of 20 feet between grids. Grids shall be installed in an irrigated area.

C. When tested, grounding grid shall have an earth resistance no greater than 5 ohms. If earth resistance is greater than 5 ohms, additional grounding plates
3.12 SYSTEM TESTING, START-UP AND ADJUSTMENT

A. Flushing:

1. After all piping, valves, sprinkler bodies, pipe lines and risers are in place and connected, but prior to installation of sprinkler internals, open the control valves and flush out the system under a full head of water.
2. Initial flushing of lines shall never be through sprinkler heads. Sprinkler internals, flush caps and riser nozzles shall be installed only after flushing of the system has been accomplished to the full satisfaction of the Owner’s Representative.
3. Contractor shall be responsible for flushing the entire system after installation is complete and will be responsible for any clogged nozzles for 30 days after substantial completion of this portion of the landscape irrigation system.

B. Testing:

1. Leakage Test: With zone valves closed, pressure test mainlines by supplying and maintaining full static pressure continuously for one full hour. Observe for evidence of leakage by monitoring flow meter and by visual inspection of the exposed lines. Repair all leaks and retest until no water flow is observed. Owner's Representative must be contacted to inspect and witness the leak testing procedures.
2. Coverage test: perform a coverage test in the presence of the Owner's Representative (notify Landscape Architect at least 7 days in advance of scheduled coverage test). Owner's representative will determine if the water coverage and dispersion is complete and adequate. Readjust heads and/or head locations as necessary or directed to achieve proper coverage. After landscape finish grading is accomplished, install heads to finished grade in lawn and shrub areas and backfill with clean topsoil so head is stabilized and no lateral motion is exhibited during operation. Heads shall be set so the tip of the heads are 1/2-inch above the top of the mulch in planting beds. Heads in the turf areas shall be set flush with the finished grade and not a hazard to pedestrians and/or maintenance machinery. Set sprinkler heads to plumb within 1/16-inch and a minimum of 4 inches and a maximum of 6 inches from walls, walks and curbs.
3. Sprinkler heads to be spaced so as not to throw water on the buildings, walks or driveways. Heads shall be adjusted as required so that foliage of plants will not obstruct the spray and that the system has 100 percent coverage.
4. Contractor shall conduct a performance test of the complete system to ensure that all components are functioning properly. Performance test shall consist of operating the system through a complete irrigation cycle per day for 2 consecutive days. Contractor shall be at the site to monitor the performance test and make any adjustments and corrections as needed during the testing period.

5. All testing shall be at the expense of the Contractor.

3.13 CLEANING AND ADJUSTING

A. At the completion of the work, all parts of the installation shall be thoroughly cleaned. All equipment, pipe, valves and fittings shall be cleaned of grease, metal cuttings and sludge which may have accumulated by the operation of the system for testing.

B. Adjust sprinkler heads, valve boxes, and quick coupling valves to grade as required, so that they will not be damaged by mowing operations.

C. Continue sprinkler coverage adjustment as required by settlement, etc., throughout the guarantee period.

D. Each control zone shall be operated for a minimum of 5 minutes and all heads checked for consistency of delivering water. Adjustments shall be made to sprinklers that are not consistent to the point that they match the manufacturer's standards. All sprinklers, valves, timing devices or other mechanical or electrical components, which fail to meet these standards, shall be rejected, replaced and tested until they meet the manufacturer's standards.

3.14 ACCEPTANCE AND OPERATION BY OWNER

A. Upon completion of the work and acceptance by the Owner, the Contractor shall be responsible for the training of the Owner’s Representative in the operation of the system (provide minimum 72 hours written notice in advance of test). The Contractor shall furnish, in addition to the Record Drawings and operational manuals, copies of all available specification sheets and catalog sheets to the Owner's personnel responsible for the operation of the irrigation system. The Contractor shall guarantee all parts and labor for a minimum period of 1 year from date of acceptance.

B. Conditions for acceptability of work for start of maintenance by Owner issued by Owner or Owner’s Representative shall include but not be limited to:

1. Punch list items complete and approved by Owner or Owner’s Representative.
2. Landscape irrigation system complete and in place.
3. Record Drawings complete.
4. Maintain installation and watering schedules until all conditions noted above have been completed.

3.15 CLEAN UP

A. Upon completion of all installation work, Contractor shall remove all leftover materials and equipment from the site in a safe and legal manner.

B. Contractor shall remove all debris resulting from work of this section.

C. Contractor shall regrade, lightly compact, and replant around sprinkler heads where necessary to maintain proper vertical positioning in relation to established grade.

D. Contractor shall fill all depressions and eroded channels with sufficient soil mix to adjust grade to ensure proper drainage. Compact lightly, and replant filled areas in accord with Owner’s Representative’s requirements.

END OF SECTION
SECTION 32 91 13.19
PLANTING SOIL SYSTEM PROCUREMENT

PART 1  GENERAL

1.01  GENERAL

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, and Division 01, General Requirements Specification Sections, apply to this Section.

B. Examine all Drawings and other Sections of the Specifications for requirements therein affecting the work of this trade and equipment for Planting Soil Mix manufacturing and shipping, or as may be reasonably inferred from the Drawings and as described in the Specifications.

1.02  WORK OF THIS SECTION

A. The scope of work intended under this section includes furnishing all labor, materials, tools and equipment for planting soil components and soil mix manufacturing and shipping, or as may be reasonably inferred from the Drawings and as described in the Specifications. Such work shall include, but is not limited to, the following:

1. Furnish the Planting Soil Components:
   a. Base planting soil (base loam).
   b. Compost.
   c. Processed sand.
   d. Geofiber stabilization material.
   e. Gravel.

2. Blend the planting soil mixes that when installed will constitute the planting soil profiles.
   a. Horticultural subsoil.
   b. Planting soil.
   c. Gravel mix soil.

3. Testing and analysis for specification conformance.

1.03  RELATED SECTIONS

A. The following items of related work are specified and included in other Sections of the Specifications:

1. Section 31 23 13, Subgrade Preparation.
2. Section 31 23 16, Excavation.
3. Section 31 23 23, Fill and Backfill.
4. Section 31 32 19.16, Geotextile.
5. Section 31 37 00, Riprap.
6. Section 32 84 00, Landscape Irrigation.
7. Section 32 91 19.13, Planting Soil System Installation.
8. Section 32 92 01, Prairies, Meadows, and Wetlands.
9. Section 32 93 00, Planting and Fine Grading.

1.04 DEFINITIONS

A. Compaction: Compaction of the soil fabric is any force applied to the soil that reduces porosity and where 90 percent of all compaction can be accomplished with only three applications of force under optimum soil moisture conditions.

B. Contractor: The Contractor performing the work specified herein.

C. Dry Soil: The condition of the soil at or below the wilting point of plant available water in which the soil is powdery and subject to blowing.

D. Frozen Soil: The point at which the soil water has frozen and the soil has become very hard and cloddy. Ice crystals can be seen in the pore spaces of the soil.

E. Field Capacity: The percentage of water remaining in a soil 2 or 3 days after having been saturated and after free gravimetric drainage has ceased.

F. Moist Soil: The condition of the soil in where it can be formed into a ball and maintain its shape. Deformation of the soil is difficult with hand pressure. Free water is not visible and is usually considered the point between the wilting point and field capacity of the soil.

G. Planting Soils for Soil Types: Soil produced off-site by homogeneously blending mineral soils with mature stabilized organic compost and/or geofibers to produce a specified planting soil mix.

H. Planting Soil Profile: The assembly of planting soil types in a defined sequence and to specified depths to meet specific horticultural or engineering objectives.

I. Saturated: All the pore space within a soil is filled with water and the remaining water is under gravitational forces to drain through the profile.
J. Scarification: The loosening of the surface of a soil lift by mechanical or manual means to alleviate compaction or smoothed surfaces of the soil. Depth of scarification is dependent on material and extent of compaction. Depths are noted within the specifications.

K. Subsoil: The soil horizon directly below topsoil that provides water holding and structural support to plants. Source of the majority of micro-nutrients.

L. Subgrade: The in-situ soil material that the planting soil will be installed upon.

M. Topsoil:

1. The mineral surface layer of soil that exhibit obliteration of all or much of the original rock structure and must show the following: (1) an accumulation of humified organic matter closely mixed with the mineral fraction and not dominated by properties characteristic of subsurface horizons; (2) has reasonable tilth (biological, chemical and physical properties) to support plant growth; as well as the following qualities:
   a. A bulk density of less than 1.4 g/cc installed.
   b. Less than 10 percent by weight coarse fragments greater than 2 mm.
   c. Loose, friable structure (easily broken into crumbs or peds), no massive structure.
   d. No contamination (i.e., Toxic weeds, chemicals, heavy metals, construction debris).

N. USDA: United States Department of Agriculture.

O. Wet Soils: Soils that are considered wet will easily be deformed by hand pressure, maintain their shape, and free water will be visible within the pore spaces. The water content at this soil condition is considered at field capacity or wetter.

1.05 REFERENCES AND STANDARDS

A. All standards shall include the latest additions and amendments as of the date of advertisement for bids. For each type of packaged material required for the Work of this Section, provide manufacturer’s certified analysis. For all other materials, provide complete analysis by a recognized approved laboratory made in strict compliance with the standards and procedures of the following:

3. ASTM International (ASTM):
   e. D854-02, Specific Gravity of Soil.
   i. D3665, Random Sampling of Construction Materials.

   b. Percent Fiber Analysis.
   c. Infiltration Rate.

5. Soil Science Society of America.

1.06 SUBMITTALS

A. Qualifications: Candidate Contractor shall submit at least three project references, including project address, dollar value, owner’s, and Landscape Architect’s contact information (name, phone, and email).

1. Contractor shall have at least 5 years’ experience in blending designed soil mixes. Candidate Contractor shall submit written documentation of at least 5 years of contracting and landscape construction experience completing projects of similar scope, complexity and value.
B. Sources for Soil Components and Planting Soil Mixes: Submit information identifying sources for all soil components and the Contractor responsible for mixing of planting soil mixes.

1. Owner or Landscape Architect shall have the right to reject any soil supplier.
2. Soil mix supplier shall have a minimum of 5 years’ experience at supplying custom planting soil mixes.
3. Submit for approval all Soil Suppliers that may provide required planting soil mixes or components.
   a. Provide name, address, telephone number and contact name.
4. Submit certification that accepted supplier is able to provide sufficient quantities of materials and mixes for the entire project. Indicate quantity and type of material from each supplier.

C. Product Data: Submit technical descriptive data for each manufactured or packaged product of this Section. Include manufacturer’s product testing and analysis and installation instructions for manufactured or processed items and materials.

D. Laboratory Test Reports: Submit certified reports from approved laboratories for tests as described in this Section.

E. Physical Samples:

1. Concurrently with the submission of laboratory test reports, the Contractor shall submit to the Landscape Architect duplicate one 1-gallon sample bags for:
   a. Base planting soil(s).
   b. Compost.
   c. Processed sand.
   d. Geofiber stabilization material.
   e. Planting Soil Mixes:
      1) Horticultural subsoil.
      2) Planting soil.
      3) Gravel mix soil.

F. Certificates: Provide certificates of compost completion/maturation/stability as specified by the U.S. Composting Council.
1.07 QUALITY ASSURANCE

A. Long Lead Time Item: The Contractor shall be advised that the sourcing, testing, procurement and installation of planting soil is a CRITICAL PATH item, requiring timely attention to meet the requirements of the Documents. Having been informed that all aspects of planting soil, the Contractor shall consider this to be A LONG LEAD TIME ITEM. Contractor’s failure to heed this notice shall not be a reason for substitution of unacceptable material(s). Materials that do not meet requirements will not be accepted.

B. Construction Conferences:

1. Presubmittal Conference: In addition to the requirements of Section 01 31 13, Project Coordination, and Section 01 31 19, Project Meetings, a Conference to discuss the work of this section shall be held with the Landscape Architect and Soil Scientist prior to beginning submittals for this Section.

2. Preblending Conference: A preblending conference with the Landscape Architect and Soil Scientist is required for the work of this section and shall be held prior to starting full production blending.

C. Qualifications:

1. In addition to the requirements of Section 01 45 16.13, Contractor Quality Control:
   a. Contractor shall have at least 5 years’ experience in blending designed soil mixes. Candidate Contractor shall submit written documentation of at least 5 years of contracting and landscape construction experience completing projects of similar scope, complexity and value.
   b. Sources for planting soil materials shall have a minimum of 5 years’ experience at supplying custom planting soil mixes and shall be able to certify that they are able to provide sufficient quantities of materials and mixes, including indicating quantities available.
   c. Testing Laboratory Qualifications: An independent laboratory, recognized by the State Department of Agriculture, with experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.
      1) Employ a qualified independent testing and inspection laboratory acceptable to the Landscape Architect and Owner to perform tests and certifications indicated. It is the responsibility of Contractor in conjunction with the Soil Supplier to submit material for the soil and compost tests.
Tests shall be made in strict compliance with the standards of the Association of Official Analytical Chemists and follow standards from ASTM, EPA, and/or Methods of Soil Analysis, Soil Science Society of America.

D. Record-keeping Log:

1. Maintain an activity log tracking the following:
   a. Planting Soil Mix Production: Date, weather, type of soil produced, volume, in cubic yards of soil produced.
   b. Record-keeping log is cumulative; every bi-weekly update is appended to the previous submission.
   c. Volume of planting soil materials on hand at the Contractor’s mixing/blending facility:
      1) Base planting soil(s).
      2) Compost.
      3) Processed sand.
      4) Planting soil mixes, all types.
   d. Volume of Planting Soil Delivered to the Project Site:
      1) Record:
         a) Type(s) of planting soil mixes delivered.
         b) Total volume in cubic yards, for each planting soil mix delivered.
   e. Testing:
      1) Include for each soil material:
         a) Include material type, test type, date, and interval or location. Record both acceptable and unacceptable findings. Immediately report unacceptable test reports to the Landscape Architect. Submit all test reports to the Owner’s Representative and Landscape Architect.
      f. Submit updates to the Owner’s Representative and Landscape Architect on a bi-weekly basis.
      g. Submit a complete record-keeping log to the Owner’s Representative and Landscape Architect at closeout.

1.08 TESTING

A. General:

1. Samples of all soil materials shall be submitted for testing and analysis to the approved testing laboratory. All soil materials shall be tested to confirm to the specified characteristics.
2. No planting soil components or mixes shall be used until certified test reports by an approved testing laboratory have been received and approved by the Landscape Architect.

3. Laboratory Qualifications: An independent laboratory, recognized by the State Department of Agriculture, with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.
   a. Employ at Contractor’s expense a qualified independent testing and inspection laboratory acceptable to the Landscape Architect, Soil Scientist, and Owner to perform tests and certifications indicated. Tests shall be made in strict compliance with the standards of the Association of Official Analytical Chemists and ASTM.

4. Maintain clear, concise records for all testing and sampling procedures and log activities and results in the record keeping log.

5. All tests shall be made on the specific materials proposed for use on this Project.

B. Testing Facilities:

1. For each test type, use the same testing laboratory throughout the work. Notify Owner’s Representative and Landscape Architect of any change in laboratory and do not proceed until Landscape Architect has approved the change.

2. Laboratory shall be an independent laboratory with experience and capability to conduct the testing indicated and that specializes in the types of tests to be performed.

3. The following testing facilities have been pre-approved for testing of planting soil components and blended planting soil mixes. Testing agencies not listed below shall be approved by the Landscape Architect.
   a. Soil Physical Parameters:
      2) University of Massachusetts, West Experiment Station, Amherst, MA 01003, Telephone: (413) 545-2311, Fax: (413) 545-1931.
      3) “Or-equal.”
   b. Compost Testing:
      1) Woods End Research Laboratory, 290 Belgrade Road, Mt. Vernon ME 04352, Telephone: (207) 293-2457, Fax: (207) 293-2488, www.woodsend.org.
2) University of Missouri Soil and Plant Testing Laboratory,  
23 Mumford Hall, Columbia, MO 65211, Telephone: (573) 882-0623.  
3) “Or-equal.”

c. Soil Chemical Properties/Micronutrient Testing:  
1) Midwest Testing Laboratories, 2645 Gravois Avenue, Saint Louis, MO 63118, Telephone: (314) 773-3035.  
2) University of Missouri, Soil and Plant Testing Laboratory,  
23 Mumford Hall, Columbia, MO 65211, Telephone: (573) 882-0623.  
3) “Or-equal.”

d. Biological Testing:  
1) Soil Foodweb, Inc., 1645 Washington Avenue Bohemia, NY, 11716, Telephone: (631) 750-1553  
2) Earthfort Laboratory, 635 S.W. Western Blvd, Corvallis, OR 97333, Telephone: (541) 257-2612.  
3) “Or-equal.”

C. Test Definitions and Methods:

1. Soil Physical Properties: Particle size distribution by ASTM D422-63 for all planting soil components, mixes and existing silt loam.  
a. Mechanical gradation (sieve analysis) shall be performed and compared to the USDA Soil Classification System for sieve screen sizes 4, 10, 18, 35, 60, 140, and 270.  
b. Tests for silt and clay shall be by combined hydrometer and wet sieving in compliance with ASTM D422-63, hydrometer method. Percent clay and silt shall be tested and reported as separate particles.  
c. The results of gradation must be reported at the specified particle size breaks listed in this Section and by plotting as a particle size distribution curve on a five cycle semi-log graph.

2. Soil Chemical Properties:  
a. General: Testing shall be conducted in accordance with Methods and Method References in association with the Missouri Soil Testing Association Accreditation Program.
b. Testing for soil chemistry shall include Total Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Aluminum, Manganese, Lead, Cation Exchange Capacity (CEC), Soluble Salts, and acidity (pH).

1) Nutrient content shall be determined by the “Soil Test of Missouri Extension Office – St. Louis County” or equivalent laboratory.
   a) Available phosphorus shall be determined by the Melich-3 Method.
   b) ppm equals mg.kg-1.

2) Test for soil Soluble Salts shall be by the 1:2 (v:v) soil-water Extract Method as described in Test for Buffer pH by the SMP method.
   a) Reference:
      (1) Soluble Salts: Recommended Chemical Soil Test Procedures for the North Central Region.
   b) ds equals deciSiemens (Conductivity) equals mnhos.cm-1.

3) Test for soil CEC (Cation Exchange Capacity) by exchangeable acidity method.

4) Test for soil pH shall be determined from a 1:1 soil-distilled water suspension using a glass electrode pH meter.

c. Total Organic Matter:
   1) Test for soil organic matter content.
   2) References:

3. Biological Properties (Direct Microscopy):
   a. Active bacterial biomass.
   b. Total bacterial biomass.
   c. Active fungal biomass.
   d. Total fungal biomass.
   e. Protozoa, to include flagellates, amoebae, and ciliates.
   f. Total nematode numbers.
g. Hyphal diameter.
h. Total available N from biological cycling, reported as pounds per acre.

4. Compost: Maturity Index:
   a. Maturity shall be assessed in one of the following methods.
      Protocols for each method are specified by the “U.S. Composting Council Seal of Testing Assurance” and the Solvita manual (version 3.5).
      1) CO2 Evolution test (respirometry).
      2) Reheating Test: Use the Dewar self-heating test.
      3) Solvita test.

5. Compost:
   a. Physical and Chemical Requirements:
      1) Reaction (pH) in 1:1 water.
      2) Carbon/Nitrogen ratio (C:N).
      3) Foreign material on a dry weight basis.
      4) Organic matter percent on a dry weight basis.
      5) Ammonium-N using an extract method.
      6) Salinity using a 1:1 water paste method.
      7) Basic Nutrient content of macro nutrients (P, K, Ca, Mg).
      8) The compost material must be tested to meet EPA Chapter 503 and/or applicable Oklahoma Department of Environmental Quality levels for human use.
      9) E. coli, in conformance with USDA testing procedures.

6. Geofibers: The application rate of fiber reinforcement shall be verified by a Percentage of Fiber Analysis, a test developed by Turf Diagnostics and Design.

7. Gravel: Test for Physical and Chemical properties in accordance with the requirements of this Article.

1.09 SAMPLING AND TESTING FOR APPROVAL

A. Sampling:

   1. Sample and perform soil tests to demonstrate that materials meet the specifications. Approved tests shall become the standard for the job.
      a. No base loam, planting soil component or planting soil mix shall be used until certified test reports by an approved Testing Agency have been approved by the Landscape Architect.
      b. The Landscape Architect may request additional testing by the Contractor for confirmation of mix quality and/or soil mix amendments at any time until delivery to the site.
      c. If, at any time during the project, the planting soil components, base loam or planting soil mixes require adjustment to meet the
specifications and/or performance criteria then the Contractor shall submit the adjusted soil components and/or mixes for testing as specified herein.

d. Additional testing for re-approval shall be required should any of the material sources change after initial approval.

2. Sampling Methods:
   a. Compost and Planting Soil Mixes: All samples shall be composite samples that are assembled from a minimum of six subsamples taken from the stockpiled material. Blend samples together and submit for testing the quantity required by the testing agency.
      1) Compost samples shall be taken from the interior of the stockpile.

B. Testing shall be Sequenced such that Approvals Build upon prior Successful Tests, as follows:

1. Gain the Landscape Architect’s acceptance of testing for planting soil components (source loam, compost, and dry screened sand) prior to testing base loam(s) for approval.
2. Gain the Landscape Architect’s acceptance of the base loam testing prior to testing planting soil mixes for approval.
3. Gain the Landscape Architect’s acceptance of each planting soil mix test specified in Article Planting Soil Mixes of this Section prior to producing a particular planting soil mix.

C. Testing of Planting Soil Components:

1. Base loams shall be tested for mechanical gradation (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Physical Properties) and soil chemical properties (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Chemical Properties).
   a. Samples shall be collected from each 12-inch depth interval of source area and labeled with source name, sample location (at source), and depth interval. Samples should be collected from each 10 acres of soil source area.
2. Compost shall be tested for compost maturity (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Compost: Maturity Index), compost chemical and physical requirements (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Compost), and biological properties (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Biological Properties (Direct Microscopy)).

D. Testing of Base Loams: After tests for planting soil components have been accepted, create sample mixes of the Base Loams and test for mechanical gradation (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Physical Properties) and soil chemical properties (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Chemical Properties).

E. Testing of Planting Soil Mixes:

1. After tests for Base Loams have been accepted, create sample mixes of each planting soil mix for approval. Tests required shall include:

1.10 ONGOING SAMPLING AND TESTING OF APPROVED MATERIAL (PRODUCTION RUN)

A. Sampling:

1. During soil blending operations, samples shall be collected for quality assurance. Collect samples in accordance with this Specification. Each sample shall be labeled with the planting soil mix, batch number, and date of sample. Collect samples and test at the following interval:
   a. Base Loam: Samples shall be collected and tested for every 1,000 cubic yards. Test shall be for mechanical gradation (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Physical Properties).
b. Planting Soil Mixes: Samples shall be collected and tested for every 1,000 cubic yards of planting soil mix during soil blending production.

1) Required Tests:
   a) Horticultural Subsoil: Chemical properties (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Chemical Properties).
   b) Planting Soil (A1 and A1F) and Gravel Mix Soil (GMX): Mechanical gradation (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Physical Properties) and chemical properties (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Soil Chemical Properties).

c. Compost:
   1) Samples shall be collected and tested for every 1,000 cubic yards of compost used during soil blending production.

   Required tests:
   a) Biological properties (direct, microscopy) (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Biological Properties (Direct Microscopy).
   b) Compost: Maturity index (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Compost: Maturity Index).
   c) Compost: Physical and chemical requirements (Article Testing, Paragraph Test Definitions and Methods, Subparagraph Compost).

d. For each 1,000-cubic yard Batch of Production Run Tests:
   1) Tests for salvage loam shall be approved prior to blending into base loam or blending into planting soil mixes.
   2) Tests for base loam and compost shall be approved prior to blending into planting soil mixes.
   3) Tests for planting soil mixes shall be completed and approved prior to delivering to the Project site and/or installation.

e. After base loams, compost and planting soil mixes (per type) have successfully passed three consecutive tests, frequency for testing of that particular item may be decreased to one test every 2,500 cubic yards.
1.11 ACCEPTANCE

A. The Landscape Architect and Soil Scientist shall evaluate all of the test results and reserve the right to reject, at any time, any soil that does not meet the baseline criteria for acceptance.

1. The baseline criterion for acceptance is established by the Landscape Architect when the initial tests for components, base loam and planting soil mixes are approved.

2. Physical soil samples shall be submitted to the Landscape Architect for physical examination. Examination will be for evidence of petroleum contamination, sulfur, mineralized organics including but not limited to slag, presence of saline components, construction debris, gravel beyond the specified limits, and other deleterious elements. The presence of these contaminants and/or materials will be cause for rejection of the soils despite acceptable test results for gradation and chemistry.

B. Rejected planting soil components or mixes shall not be delivered to or installed on the Project site.

1.12 GUARANTY

A. The work in this Specification shall be subject to the guaranty requirements as described within Division 01, General Requirements of the Project Manual.

PART 2 PRODUCTS

2.01 PLANTING SOIL COMPONENTS

A. Base Loam A:

1. Base Loam A soil shall consist of a uniform sandy loam soil from a clean source with the following requirements:
   a. Gradations shall conform to the following grain size distribution for material passing the No. 4 sieve:

<table>
<thead>
<tr>
<th>U.S. Sieve Size</th>
<th>% Passing Minimum</th>
<th>% Passing Maximum</th>
</tr>
</thead>
<tbody>
<tr>

2. Base Loam A shall have organic matter content between 0.25 percent and 2.5 percent on a dry weight basis.
3. Base Loam A soil shall not contain objects larger than 1/2-inch in any dimension, including clay clods, gravel, or other foreign matter.

B. Dry Screened Sand:

1. Sand for amending existing (salvaged) loam or Base Loam A soil shall be a naturally occurring, uniformly graded coarse sand consisting of clean, inert, rounded to sub-angular grains of quartz or other durable rock free from loam or clay, surface coatings, mica, and other deleterious materials. There shall be no coarse fragments over 2.5 cm in size or visible organic matter present in this layer. Particle size distribution for material passing a No. 4 Sieve shall be:
2. The pH shall not exceed 7.2.

C. Compost:
   1. Compost shall be a stable, humus-like material produced from the aerobic decomposition and curing of organic vegetative residues derived from feedstock consisting of woody stems, leaves, grass cuttings, and livestock manure (up to 10 percent of the compost mix by volume). The compost shall be a dark brown to black color and be capable of supporting plant growth with appropriate management practices with no visible free water or dust, with no unpleasant odor.
   2. Chemical Properties:
      a. Compost shall conform to the following values:

b. The ratio of carbon to nitrogen (C:N) shall range from 10:1 to 25:1.

c. Organic matter content of compost shall be at least 40 percent (dry weight). One hundred percent of the material shall pass a 1/2-inch (or smaller) screen. Debris such as metal, glass, plastic, wood (other than residual chips), asphalt or masonry shall not be visible and shall not exceed one percent dry weight.

d. The compost shall be screened to 1/2-inch maximum particle size and shall contain no more that 3 percent material finer than 1.0 mm (No. 18 sieve) as determined by sieve analysis.

e. Additional tests defined in Part I as chemical properties shall be performed, and the results will be utilized to evaluate amendments to the planting soil mixes that may be required.

3. Maturity:

a. C0² Test: Compost respiration shall be no more than 6 mg C02-C1gBVS day.

b. Reheating Test: The maximum heat rise shall be no greater than 9 degrees C above room temperature (20 degrees C to 25 degrees C).

c. Solvita Test: The compost must achieve a maturity index of six or more.

4. Biological Values:

a. Active bacteria and fungi are not to be higher than 10 percent of total bacteria and fungi respectfully.

b. Total bacteria to be a minimum of 500 ug/g.

c. Total fungi to be a minimum of 400 ug/g.

d. Protozoa to be 100,000 (amoeba and flagellates with no more 3,000 ciliates).

e. Nematodes minimum of 10 beneficial, no root feeders.

6. Total Available N from Biological Cycling: 150 pounds per acre.

D. Gravel:

1. Gravel for gravel mix horizon in meadow planting soil shall consist of sound, tough, durable crushed or uncrushed gravel; free from soft, thin, elongated or laminated pieces and organic or other deleterious substances. The gravel mix shall consist of angular, well-graded stone. Gravel color shall be approved by the Landscape Architect. Gravel shall be washed. Gradation requirements shall be as follows:

a. Gravel: 3/4-inch angular crushed stone.
E. Geofiber Reinforcement: Provide 100 percent polypropylene fiber reinforcement as supplied by Fiber Soils, LLC, P.O. Box 80198, Baton Rouge, LA 70898, Telephone: (225) 757-9136; Fax: (225) 752-7975.

1. Geofiber Reinforcement:
   a. Provide 3620BF fiber reinforcement batch mixed with soil profiles as specified herein to the area(s) designated on Drawings. Fiber reinforcement shall conform to the following minimum specifications:

F. Sources for Soil Components and Planting Soil Mixes.

1. All planting soil mix materials shall fulfill the requirements as specified and be tested to confirm the specified characteristics. Submit certification that accepted supplier is able to provide sufficient quantities of materials and mixes for the entire project.

2. Sources for planting soil components may include the providers listed below. No guarantee is made or implied that the sources listed will be able to meet the soil material specifications. The listing of sources does not preapprove the soil material.
   a. Base Loam A Soil (Sandy Loam):
      1) Gem Dirt Sales, LLC, 2526 W. 101st St., Tulsa, OK 74132, Telephone: (918) 298-0299.
      2) Enterprise Dirt Sales, 5909 W. Hilton Rd, Sapulpa, OK 74066, Telephone: (918) 224-6440.
      3) “Or-equal.”
b. Compost:
   1) Gem Dirt Sales, LLC, 2526 W. 101st St, Tulsa, OK 74132, Telephone: (918) 298-0299.
   2) “Or-equal.”

2.02 PLANTING SOIL MIXES – REFERENCE CHART

A. Planting soils shall consist of base loam soils or dry screened sand blended with compost in the ratios presented in the following chart and specified herein. Mix ratios are approximate and shall be adjusted as required to meet the specific requirements of the planting soil mixes.

<table>

2.03 PLANTING SOIL MIXES

A. Horticultural Subsoil (HS):

1. Horticultural subsoil shall consist of nine parts Base Loam A soil and one part compost by volume (9:1 Ratio). Horticultural subsoil shall be free of solids larger than 1/2-inch in any dimension and not consisting of such solids more than 2 percent by volume.

2. Mechanical Gradation: The horticultural subsoil shall be a uniform, homogenized mixture of the soil components with a gradation conforming to the approved Base Loam A soil.

3. Properties shall meet the following:
   a. Organic Content: Between 0.5 percent and 2.0 percent on a dry weight basis.
   b. pH: 6.5 to 7.5.
   c. Total nitrogen (all forms) between 50 mg/kg to 200 mg/kg soil.
   d. Available nitrogen (NH4 and NO3) between 10 mg/kg to 80 mg/kg.
   e. Total available P content between 5 mg/kg to 50 mg/kg.
B. Planting Soil (A1):
   1. Planting soil shall consist of a blend of Base Loam A (sandy loam) soil combined with compost, both meeting the requirements specified herein, at an approximate mix ratio of three parts by volume Base Loam A to one part by volume compost to create a uniform blend.
      a. Total nitrogen (all forms) content of the planting soil (including blended compost) shall range from 150 mg/kg to 400 mg/kg soil, with available nitrogen (NH4 and NO3) content between 50 mg/kg to 100 mg/kg. Total available P content shall be in the range of 20 mg/kg to 40 mg/kg.

C. Gravel Mix Soil (GMX): Gravel mix soil shall consist of a blend of compost, sand and gravel all meeting the requirements specified herein, at an approximate mix ratio of two parts by volume dry screened sand to one part by volume compost to one part by volume gravel.

PART 3 EXECUTION

3.01 GENERAL
   A. Material should not be handled or hauled, placed or compacted when it is wet as after a heavy rainfall or is frozen. Soil should be handled only when the moisture content is less than at field capacity. The Landscape Architect shall be consulted to determine if the soil is too wet to handle.
   B. Delivery of all soil types referred to in this Section will be coordinated and sequenced to minimize stocking time on Owner’s site. Only requested volumes will be delivered on agreed-upon dates.
   C. Care will be taken to prevent co-mixing and contamination of soil materials before and during delivery.
   D. The final prepared planting soil mixes will be delivered to the site where the Landscape Architect will review them for approval prior to installation.

3.02 BLENDING OF PLANTING SOIL MIXES
   A. All planting soils will be blended to a uniform, homogenous mix as specified in Part 2 of this Section.
   B. All mixing shall be accomplished when the soil moisture content is less than 20 percent by weight.
All planting soil mixes must be blended to a uniform mixture using a rotating Trommel screen or equivalent with 3/8-inch screen openings to produce the final planting soil mix. Bucket blending of soil mixes is only acceptable as a PRELIMINARY mixing of individual planting soil components if necessary prior to blending the planting soil mixes specified in Article Planting Soil Mixes of this Section.

Hammer mills or blending knives are not permitted in preparation of the soil as these processes pulverize the soils and reduce soil structural stability.

Compost shall be maintained dry to moist, not wet, during mixing.

No amendments shall be added unless approved by the Landscape Architect and Soil Scientist and additional tests have been conducted to verify type and quantity of amendments acceptable.

Material should not be handled or hauled, when it is wet or frozen. Soil should be handled only when the moisture content is less than at field capacity. The Landscape Architect shall be consulted to determine if the soil is too wet to handle.

Soil Material that is handled wet shall be discarded.

Inspect all stockpiles weekly for the presence of invasive or weedy species. Remove material within 14 days with hand pulling. If visibly flowering, the weed must be physically removed.

Stockpile each soil material separately and provide large, clear signage identifying the contents of each pile, for example; “Sand” or “Base Loam A” or “Tree Planting Soil.” Provide perforated aeration pipe within the soil stockpiles.

1. Height of Pile: Soil stockpiles shall not exceed 12 feet in height.
   a. Layout: Lay aeration pipe horizontally in the soil stockpile. Pipe shall extend from the face of the stockpile by a minimum of 18 inches. Provide three layers of pipes: one at ground level, one at 4 feet height, and one at 8 feet height. Provide pipes 15 feet on center for each layer. Stagger each layer by 1/3 the distance between pipes. Slope pipes at 1 percent.
   b. The requirement for Aeration pipe will be waived if the height of the stockpile does not exceed 6 feet.
3. Protection:
   a. Construct storage piles to allow free drainage of surface water. Slope top of pile a minimum of 3 percent.
   b. Cover storage piles if required to prevent windblown dust and protect against erosion.
   c. Protect stockpiles from contamination of any sort.
   d. Prohibit vehicles and pedestrian traffic on or around stockpiled soil materials.
      1) Only low ground pressure vehicles are permitted to drive on stockpiles. psi shall be below 4.

4. In no case shall the stockpiled soil be allowed to go anaerobic as this condition is irreversible and renders the soil unusable for planting. The Contractor shall keep logs for soil management while it is in stockpiles. If the Contractor suspects that stockpiled soils have become anaerobic, notify the Landscape Architect and wait for further instructions before aerating stockpiles.

3.04 SEQUENCING AND SCHEDULING

A. The Contractor is responsible for coordinating blending, shipping and delivery of planting soils so that the components of stockpiled mixes do not segregate, comingle or become contaminated.

B. Sequence deliveries to avoid delay.

3.05 PLACEMENT OF PLANTING SOIL MIXES

A. Refer to Section 32 91 19.13, Planting Soil System Installation.

3.06 EXCESS MATERIALS

A. After all work for the Project is completed and accepted, the Contractor shall be responsible for legal disposal of all unused soil components and mixes that are stored on site or at the Contractor’s facility.

END OF SECTION
SECTION 32 91 19.13
PLANTING SOIL SYSTEM INSTALLATION

PART 1 GENERAL

1.01 GENERAL

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, and Division 01, General Requirements Specification Sections, apply to this Section.

B. Examine all Drawings and other Sections of the Specifications for requirements therein affecting the work of this trade and equipment for Planting Soil Mix manufacturing and shipping, or as may be reasonably inferred from the Drawings and as described in the Specifications.

1.02 WORK OF THE SECTION

A. This section includes furnishing all labor, materials, tools, and equipment for Planting Soil installation, or as may be reasonably inferred from the Contract Documents. Such work shall include but is not limited to the following:

1. Preparation of subgrade.
2. Evaluation and testing of rough subgrade water infiltration.
3. Coordination of sequencing, supply, testing and delivery of imported/manufactured soil materials.
   a. Refer to Section 32 91 13.19, Planting Soil System Procurement.
4. Installation and placement of soils.
5. Testing and analysis for specification conformance.
6. Record-keeping Log.
7. Coordination with other trades.
8. Clean-up.

1.03 RELATED SECTIONS

A. The following items of related work are specified and included in other Sections of the Specifications:

1. Section 31 10 00, Site Clearing.
2. Section 31 23 13, Subgrade Preparation.
3. Section 31 23 16, Excavation.
4. Section 31 23 23, Fill and Backfill.
5. Section 32 84 00, Landscape Irrigation.
7. Section 32 92 01, Prairies, Meadows, and Wetlands.
8. Section 32 93 00, Planting and Fine Grading.

1.04 REFERENCE STANDARDS FOR ANALYSIS AND TESTING

A. All standards shall include the latest editions and amendments as of the date of advertisement for bids. For each type of packaged material required for the work of this Section, provide manufacturer’s certified analysis. For all other materials, provide complete analysis by a recognized laboratory made in strict compliance with the standards and procedures of the following:

3. ASTM International (ASTM):
   d. D698, Standard Proctor Test.
   e. D3385, Standard Test Method for Infiltration Rate of Soils in Field Using Double-Ring Infiltrometer.

1.05 DEFINITIONS

A. Contractor: The Contractor performing the work specified herein.

B. Compaction: Compaction is the comparison of the physical qualities of a soil in its “at rest” (uncompacted) state versus its state after forces have been applied to the soil. Compaction results in a denser packing arrangement of soil particles that result in a reduction of porosity, an increase in bulk density, and a decrease in soil hydrologic conductivity. Over compaction of soil is the condition where the soil porosity is reduced below 40 percent pore space, the bulk density exceeds 1.4 g/cc, and hydraulic conductivity is above one.

C. Dry Soil: The condition of the soil at or below the wilting point of plant available water in which the soil is powdery and subject to blowing.

D. Frozen Soil: The point at which the soil water has frozen and the soil has become very hard and cloddy. Ice crystals can be seen in the pore spaces of the soil.
E. Field Capacity: The percentage of water remaining in a soil two or three days after having been saturated and after free gravimetric drainage has ceased. Soil that is worked above its field capacity is subject to over-compaction and damage to its structure.

F. Final Acceptance: Final Acceptance shall be the day on which the project is 100 percent complete and accepted by the Landscape Architect and Owner, including “Punch List” items. Maintenance and Warranty work shall commence at Final Acceptance.

G. Finish Grade: Elevation of finished surface of planting soil after settlement.

H. Kjeldahl Nitrogen: In chemical soil testing, the sum of organic nitrogen, ammonia (NH3), and ammonium (NH4+).

I. Moist Soil: The condition of the soil in which it can be formed into a ball and maintain its shape. Deformation of the soil is difficult with hand pressure. Free water is not visible and is usually considered the point between the wilting point and field capacity of the soil.

J. Planting Soils for Soil Profiles: Soil produced off-site or on-site from off-site sources by homogeneously blending mineral soils or sand with mature stabilized organic compost to produce specified planting soil blends.

K. Project: Refers to The Gathering Place for Tulsa construction site.

L. Saturated: All the pore space within a soil is filled with water and the remaining water is under gravitational forces to drain through the profile.

M. Scarification: The loosening of the surface of a soil lift by mechanical or manual means to alleviate crusted, minimal compaction, or smoothed surfaces of the soil. Depth of scarification is dependent on material and extent of compaction. Depths are noted within the Specifications.

N. Subsoil: The soil horizon directly below topsoil that provides water holding and structural support to plants. Source of the majority of micro-nutrients.

O. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soils.

P. Topsoil:

1. The mineral surface layer of soil that exhibit obliteration of all or much of the original rock structure and must show the following: (1) an accumulation of humified organic matter closely mixed with the mineral
fraction and not dominated by properties characteristic of subsurface horizons; (2) has reasonable tilth (biological, chemical and physical properties) to support plant growth; as well as the following qualities:

a. A bulk density of less than 1.4 g/cc installed.
b. Less than 10 percent by weight coarse fragments greater than 2 mm.
c. Loose, friable structure (easily broken into crumbs or peds), no massive structure.
d. No contamination (e.g., toxic weeds, chemicals, heavy metals, construction debris).

Q. Wet Soils: Soils that are considered wet will easily be deformed by hand pressure, maintain their shape, and free water will be visible within the pore spaces. The water content at this soil condition is considered at field capacity or wetter.

R. Redoximorphic Features: The iron staining or gray depletion of soil colors due to anaerobic soil conditions in association with a seasonal high water table.

1.06 SUBMITTALS

A. Informational Submittals:

1. In addition to the requirements of Section 01 33 00, Submittal Procedures, submit the following:
   a. In-situ Test Reports: Submit certified reports for tests as described in this Section.
   b. Laboratory Test Reports: Submit certified reports for tests as described in this Section.
   c. Schedule: In addition to the requirements of Section 01 32 00, Construction Progress Documentation, the Contractor shall submit a schedule of soil needs within 4 weeks of beginning Work, and shall resubmit the schedule when dates change.
   d. Soil mix samples collected before or during installation.
   e. Qualification Data: The Landscape Contractor shall have at least 5 years’ experience in installing designed soil mixes, completing projects similar in scope, complexity and value.
      1) Candidate Landscape Contractor shall submit at least three project references, including project address, construction dollar value, project Owner’s and Landscape Architect’s contact information (name, company, phone, and email).
   f. Record-keeping Log: Submit to Landscape Architect two times per month. Refer to Article Quality Assurance, Paragraph Record-keeping Log.
1.07 QUALITY ASSURANCE

A. Contractor’s Experience:
   1. Candidate Contractor shall submit written documentation demonstrating at least 5 years of contracting and landscape construction experience completing projects of similar scope, complexity and value.
   2. Candidate Contractor shall submit at least three project references including project address, dollar value, Owner’s and Landscape Architect’s contact information (name, phone, and email).

B. Pre-Installation Conference: In addition to the requirements of Section 01 31 13, Project Coordination, a Conference with the Landscape Architect to discuss the work of this Section shall be held prior to beginning the work of this Section.
   1. Conference shall also include the Soil Scientist. Schedule of required planting soil needs shall be discussed.

C. Planting Soil Quality Assurance: Refer to Article Testing, for soil testing requirements.

D. Record-keeping Log:
   1. Maintain an activity log tracking the following:
      a. Dates of planting soil installation including soil mix, installation time, approximate quantity, location, and weather (temperature, humidity, precipitation, cloud cover).
      b. Schedule of in-situ field testing, including date, type of test, planting soil layer and profile tested, location of test, number of tests, and weather (temperature, humidity, precipitation, cloud cover).
      c. Schedule of sampling (soil sample collection) and laboratory testing of planting soils, including date, type, lab name, location of sampling, number of tests, and weather (temperature, humidity, precipitation, cloud cover).
      d. For all tests, number each test and indicate locations of tests on a plan graphic of the Project site.

E. Planting Soil Quality Assurance: During the placement of planting soils, sample each layer of the planting soil mix for every defined planting area. Keep these samples on site for review by the Landscape Architect during the construction process. Label each sample with the planting soil mix, date of installation, general location of where it was placed, and any other notations that would be relevant such as if it was raining that day or the planting soil
was too wet or dry. If there are questions or concerns with a certain mix, the Landscape Architect shall require the QA sample to be tested.

F. Record both acceptable and unacceptable findings. Immediately report unacceptable test reports to the Landscape Architect. Submit all test reports to the Landscape Architect.

G. Provide written guaranty agreeing to remove and replace work that exhibits defects in materials or workmanship. Defects shall include settlement, poor drainage, anaerobic soils, compacted soils, or any other conditions that are detrimental to healthy plant growth.

H. Furnish certificates of inspection of landscape materials to accompany shipments, as required by governmental authorities. Comply with applicable Federal, State, County, and local regulations governing landscape materials.

1.08 TESTING

A. General:

1. Record-keeping Log for Testing: Maintain clear, concise records for all testing and sampling procedures. Log activities and results in the record-keeping log.
   a. Refer to Article Quality Assurance, Paragraph Record-keeping Log, for requirements.

2. Testing of soil biology and soil chemical properties for the purposes of promoting plant growth shall be required.

B. Testing Laboratory Qualifications: Refer to Section 32 91 13.19, Planting Soil System Procurement.

C. Testing Definitions and Methods:

1. Grab Samples:
   a. Refer to Article Quality Assurance, Paragraph Record-keeping Log.
   b. A grab sample shall consist of five discrete collections of soil homogenized into the final 1-gallon sample for submittal to the Landscape Architect.
      1) Discrete collections of soil shall be a minimum of 25 feet apart.
   c. Label each grab sample to identify planting soil mix, date of sample collection, and the location of installation.
   d. Keep these samples on site for review by the Landscape Architect and Soil Scientist during the construction process.
2. Mechanical Gradation: Refer to Section 32 91 13.19, Planting Soil System Procurement.
3. Chemical Properties: Refer to Section 32 91 13.19, Planting Soil System Procurement.
5. In-Situ Tests:
   b. Density Tests (Compaction):
      1) Nuclear Method: ASTM D6938, 10 Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).
   c. Infiltration Test: In-place percolation tests shall be performed utilizing a double ring infiltrometer, falling head, conforming to ASTM D3385-09 utilizing Turf-Tech IN2-W Infiltrometer as manufactured by Turf Tec International, 1471 Capital Circle N.W., Suite #13, Tallahassee, FL 32303, or approved alternate.
      1) Unless otherwise specified herein, in-place infiltration tests shall be carried out at a rate of one test per area (minimum) at a rate of one test per 5,000 square feet for each type of material placed.

1.09 SAMPLING AND TESTING FREQUENCY

A. Planting soil shall be sampled at the following intervals:

   1. Grab Sampling: Refer to Article Quality Assurance, Paragraph Record-keeping Log, for requirements. Keep the grab samples organized and provide the Landscape Architect and Soil Scientist access to the samples upon request. If there are questions or concerns with a planting mix, the Landscape Architect or Soil Scientist shall require the sample to be tested.

B. Testing for Subgrade:

   1. Testing is required at the following intervals:
      a. In-place Tests: Prior to placement of the planting soil profile, test the subgrade for compaction/density and infiltration in accordance with Article Sampling and Testing Frequency, Paragraph Testing for Subgrade and Planting Soil Mixes of this Section. Coordinate
the testing of the subgrade before the planting soil profile is placed.

C. Testing for Subgrade and Planting Soil Mixes:

1. Density Testing, Nuclear Method:
   a. One test per 20,000 square feet, for each of the following soil horizons:
      1) Subgrade.
      2) Horticultural Subsoil (HS).
      3) Planting Soil (A1).
      4) Gravel Soil (GMX).

2. Density Testing, Static Cone Penetrometer:
   a. Two tests per 5,000 square feet. One test shall be at the depth of 0 inch to 6-inch, and the second test shall be at the depth of 6-inch to 18-inch, for each of the following soil profiles:
      1) Subgrade.
      2) Rip Rap Planting Soil Profile (SP-RR).

3. Infiltration Test:
   a. One test per 10,000 square feet of the following soil profiles:
      1) Subgrade.
      2) Rip Rap Planting Soil Profile (SP-RR).

1.10 DELIVERY, STORAGE AND HANDLING

A. Deliver packaged materials in containers showing weight, analysis and name of manufacturer. Protect materials from deterioration during delivery, and while stored at the site.

B. Material shall not be handled or hauled, placed or compacted when it is wet as after a heavy rainfall nor when frozen. Soil should be handled only when the moisture content is less than at field capacity. The Landscape Architect, the Soil Scientist and the Construction Manager shall be consulted to determine if the soil is too wet to handle.

C. Store and handle packaged materials in strict compliance with manufacturer’s instructions and recommendations. Protect all materials from weather, damage, injury and theft.

D. Sequence deliveries to avoid delay. On-site storage space is permissible only with written notice from Construction Manager. Deliver materials only after preparations for placement of planting soils have been completed.

E. Prohibit vehicular and pedestrian traffic on or around stockpiled planting soil.
F. Soil that is to be stockpiled longer than 2 weeks, whether on or off site, shall not be placed in mounds greater than 6 feet high. If soil stockpiles greater than 6 feet high are present longer than 2 weeks then the Contractor shall break down and disperse soil so that mounds do not exceed the six-foot height restriction for longer than 2 weeks.

G. Invasive Species Control: Inspect all stockpiles weekly for the presence of invasive or weedy species. Remove material within 14 days with hand pulling. If visibly flowering, the weed must be physically removed.

H. Vehicular access to the site is restricted. Before construction, the Contractor shall submit for approval a plan showing proposed routing for deliveries and site access.

1.11 SEQUENCING AND SCHEDULING

A. The Contractor is responsible for coordinating so that the following conditions are met:

1. Components of stockpiled mixes do not segregate, come into contact or become contaminated.
2. Placement and compaction of the soils shall be coordinated to avoid damage to other installed work, such as underdrainage, aeration or irrigation systems.

1.12 GUARANTY

A. The work in this specification shall be subject to the guaranty requirements as described within Division 01, General Requirements.

1.13 ACCEPTANCE

A. If, at any time during the project, placed planting soil does not meet the specifications and/or performance criteria for density or infiltration, then the Contractor shall stop placement of all planting soil and schedule a meeting with the Landscape Architect and Soil Scientist. Steps for amending the soil in place or replacement of noncompliant planting soil shall be determined by the Landscape Architect depending on the results of the testing and site observations.

B. Request for Acceptance: In writing, request from Landscape Architect inspection for acceptance at least 10 days in advance of preferred inspection date. Do not request inspection for acceptance until work is 100 percent complete and in compliance with the Contract requirements.
C. Partial Acceptance: Acceptance of partial areas or portions of the total work may be granted, at the Landscape Architect’s option, if the area to be inspected for acceptance is large, well defined, and easily described. The Landscape Architect is not obligated to provide partial acceptance of the work.

D. Final Acceptance is defined as the time at which all work has been performed and accepted by the Landscape Architect including any work noted on the “Punch List.”

**PART 2 PRODUCTS**

2.01 **SUBGRADE**

A. Subgrade conforming to the requirements of Section 31 23 16, Excavation, Section 31 23 23, Fill and Backfill, Section 31 37 00, Riprap, and the Drawings.

2.02 **SUBGRADE AMENDMENT**

A. Subgrade amendment components shall consist of:

1. 70 percent Standard Agricultural Course Grade Humates:
   a. Shall be a naturally occurring, unaltered oxidized lignite.

2. Coarse Grade Soft-Rock Phosphate: Soft-Rock Phosphate shall not be MAP or DAP.

B. Subgrade Amendment Mix: The Contractor shall provide a subgrade amendment mix composed of 80 percent Humates and 20 percent Soft Rock Phosphates.

2.03 **PLANTING SOIL MIXES**

A. Planting soil mixes shall conform to the requirements of Section 32 91 13.19, Planting Soil System Procurement.

B. Existing Soils within Tree Driplines (SC): Existing soils within tree driplines shall be existing soils under tree canopies that will not be disturbed or graded except for seeding, aeration, or coring tools/machines for incorporation of soil treatments.
2.04 PLANTING SOIL PROFILES

A. Soil Profiles are as shown on Drawings and are composed of the planting soil mixes conforming to the requirements of Section 32 91 13.19, Planting Soil System Procurement, and as described herein. In the event of a conflict between the Drawings and the Specifications, Drawings shall take precedence.

1. Rip Rap Planting Soil Profile (SP-RR): The rip rap planting soil profile shall consist of two soil horizons (layers) as indicated on Drawings and shall be comprised of planting soil mixes conforming to the requirements of Section 32 91 13.19, Planting Soil System Procurement. This profile shall be installed in areas as indicated on Drawings. The A1 horizon (upper layer) shall be 10 inches of Gravel Mix Soil (GMX) placed over an underlying A2 horizon (middle layer) of 6 inches of Planting Soil (A1) placed over an underlying B horizon (lower layer) of 30 inches of Horticultural Subsoil (HS), over a scarified and correctly pitched subgrade.

2.05 WOVEN FILTER FABRIC

A. Filter fabric shall be a woven drainage geotextile, nonbiodegradable.

B. The permeability of the drainage fabric shall be a minimum of 110 gallons minimum per square foot.

C. Filter fabric shall meet the following Minimum Average Roll Value (MARV) specifications across the weave:

1. Weight (Typical): 5.6-ounce per square yard, according to ASTM D5261.
2. Grab Tensile Strength: 370 by 200 pounds, according to ASTM D4632.
3. Grab Elongation: 15 percent maximum, according to ASTM D4632.
4. Trapezoidal Tear Strength: 115 by 75 pounds, according to ASTM D4533.
5. Puncture Resistance: 675 pounds, according to ASTM D4833.
7. Permittivity: 2.1 gpm per square foot, according to ASTM 4491.
8. A.O.S: 40 U.S. Sieve, according to ASTM D4751.
9. Percent Open Area: 10-ounce per square yard, according to ASTM D4751.
10. UV Resistance: 70 percent, 500 hours, according to ASTM D4355.

2.06 SLOPE REINFORCEMENT SYSTEM

A. Refer to Section 31 32 19.16, Geotextile.
PART 3 EXECUTION

3.01 PREPARATION AND COORDINATION

A. Coordinate activities with other project contractors so that there is no soil disturbance from traffic or other construction activities subsequent to placement.

B. The Contractor shall ensure that the delivery of the planting soil mixes to the On-site Planting Soil Collection Area meets the Project Schedule.

C. Coordination with Weather: Planting Soil Mixes shall not be worked (including hauled, handled, placed, compacted, or tracked over) when soil is wet or frozen. Refer to Article Definitions herein for definitions of moist, wet, and frozen soil.

   1. Contractor shall take precautions to limit schedule interruptions caused by rain or freezing temperatures by tarping on-site soil stockpiles if rain is anticipated. The Landscape Architect shall be consulted to determine if the soil is too wet to work.

3.02 ON-SITE SOIL STOCKPILES WITHIN PROJECT AREAS

A. Stockpile areas within the project area are extremely limited. The Contractor shall carefully coordinate and time planting soil mix installation, obtaining and installing soil only after preparations for placement of planting soil have been completed and accepted.

   1. Coordinate activities with other Project contractors so that there is no soil disturbance from traffic or other construction activities subsequent to placement.
   2. Coordinate deliveries and installation to limit the amount of soil stockpiled stored within the project area at any one time.

B. Provide large, clear signage at each stockpile indicating the contents of each pile, for example; “Sand” or “Base Loam A” or “Tree Soil TS1.”

C. Do not locate stockpiles adjacent to unfinished work where soils can become contaminated.

D. Maximum height of stockpiles shall be 6 feet.
E. Protection: Construct storage piles to allow free drainage of surface water and provide adequate drainage around soil stockpiles. Slope top of pile a minimum of 3 percent.

1. Cover storage piles if required to prevent windblown dust and protect against erosion.
2. Protect stockpiles from contamination of any sort.
3. Prohibit vehicles and pedestrian traffic on or around stockpiled soil materials.
   a. Only low ground pressure vehicles are permitted to drive on stockpiles. psi shall be below four.

3.03 EXAMINATION, VERIFICATION AND ACCEPTANCE

A. The Contractor shall examine previous work, related work, and conditions under which this work is to be performed and shall notify the Landscape Architect in writing of all deficiencies and conditions detrimental to the proper completion of this work. Beginning work means Contractor accepts substrates, previous work, and conditions.

B. Upon receipt of delivery of planting soil mixes, the Contractor shall visually inspect the soil for moisture content, non-aggregated soil particles, clumping, debris, deleterious or foreign materials, or any other physical conditions that could affect the quality of the planting soil and the Contractor’s installation operations.

1. The Contractor shall immediately notify the Landscape Architect of any soil deliveries that exhibit any of the physical conditions noted above.
2. The Contractor shall not accept or use soil that exhibits any of the physical conditions noted above.

C. The Contractor shall be responsible for verification that all of the planting areas receiving planting soil mixes have been prepared in conformance with the Contract Documents.

1. Verify that underdrainage system has been installed and accepted.
2. Verify that the aeration system has been installed and accepted.
3. Verify that utilities have been installed and accepted.
4. Verify that slope stabilization system has been installed and accepted.
5. Verify that irrigation mainlines have been installed.
6. Verify that there is a sufficient means for on-site watering of installed plants.
D. Examination of Subgrade:

   1. The subgrade shall be examined by the Contractor prior to the start of soil placement and planting for conformance with Drawings for elevations of subgrade relative to finish grade. Deficiencies include, but not be limited to, the following:

      a. Construction debris present within the area to received planting soil mix.
      b. Puddling of water, muddy soil conditions, or expressing of water from the subgrade or adjacent areas.
      c. The subgrade is not at the correct depths for installing the designated planting soil mix.
      d. The subgrade is at incorrect depths for installing the designed soil profile.
      e. Incomplete utility, irrigation and/or subsurface drainage (landscape underdrainage) installation.
      f. Subgrade not compacted as specified. Refer to Section 31 23 23, Fill and Backfill.

E. Submit all noted deficiencies that will impact the proper installation or execution of the Work to the Landscape Architect in writing prior to beginning soil installation operations. The Contractor assumes responsibility for all subgrade work and conditions upon beginning soil installation operations.

3.04 PREPARATION OF SUBGRADE

A. The subgrade will be scarified (roughened) to a depth of 4 inches to create an uneven, broken surface in which the subgrade can be mixed with the first lift of planting soil placed. Scarification can be accomplished manually or using rototillers or equivalent machinery that does not result in the formation of subsoil pans or slickened faces.

B. Perform infiltration and density tests on subsoil as described in Part 1 of this Section.

   1. Infiltration Rate for Subgrade, Minimum: 0.25 inch per hour.
   2. Compaction Rate for Subgrade, Nuclear Density Method: Refer to Section 31 23 23, Fill and Backfill.
   3. Compaction Rate for Subgrade, Static Cone Penetrometer Method:
      a. 0 inch to 6 inch Depth: Range 120 pounds to 125 pounds per square inch (psi).
      b. 6 inch to 12 inch Depth: Range 100 psi to 200 psi.
C. Application of Subgrade Amendment Mix: Broadcast subgrade amendment mix directly to the subgrade for all areas to be planted except lawns.

1. Coordinate application of amendment with installation of horticultural subsoil. Blend material into the subgrade concurrently with installation of horticultural subsoil.
2. Application rate shall be 200 pounds per acre of coarse grade humates (80 percent of mixture) and 50 pounds per acre of soft-rock phosphate (20 percent of mixture).

3.05 SOIL PLACEMENT, GENERAL

A. Notify the Landscape Architect of soil placement operations at least 7 calendar days prior to the beginning of work or a new phase of work.

1. Delineate the limits of soil extents for review and approval by the Landscape Architect.

B. Soil types shall be installed by order of their place within the soil profiles, as shown on Drawings.

C. Plan work to limit traffic on and compaction of soil during and after installation.

1. Prevention of compacted soils can be accomplished by beginning the work in the center of planting area locations, against walls, or the center of isolated beds, and progressing outwards towards the borders.
2. If traffic is necessary, use tracked equipment that exerts less than 5 psi pressure and limit traffic to defined pathways.
3. Traffic on or installation of wet or frozen soils is expressly prohibited.

D. Coordinate soil mix placement activities with the requirements of Section 32 93 00, Planting and Fine Grading. Placement of horticultural subsoil and plant stock shall be carried out simultaneously in order to limit soil compaction.

1. The A soil horizons (e.g. A1) shall not be installed before all woody plants are installed and accepted by the Landscape Architect.
2. The Contractor shall not remove tree location stakes until trees and/or shrubs have been placed on site for review by the Landscape Architect.
ZINK DAM IMPROVEMENTS

E. Soil Moisture: Placement of planting soil mixes will not occur when soil moisture content is greater than 10 percent by weight and 12 percent volumetric water content.

1. Verify that the surface moisture content is suitable for placement operations. Under no circumstances shall the Contractor place planting soil mixes on subgrade when equipment ruts are present or conditions are favorable for rutting of the subgrade. Do not place or install any planting soil mix during precipitation events, or when the subgrade is in a frozen condition.

F. Placement of soil by back blading is not acceptable.

3.06 PLACEMENT OF HORTICULTURAL SUBSOIL AND PLANTING SOILS

A. In addition to the requirements of Section 01 31 13, Project Coordination, stake the limits of soil extents for approval by the Landscape Architect.

B. Placement of horticultural subsoil and plant stock shall be carried out simultaneously to prevent excessive traffic over soil lifts and the final grade so as to prevent compaction of planting soil. The Contractor shall install plants simultaneously with the installation of the horticultural subsoil. The A Horizon (upper layer) planting soils shall not be installed before all plants are installed and before the acceptance by the Landscape Architect.

C. The soil shall be placed in lifts not to exceed 8 inches in thickness and only moderately hand-tamped not to exceed between 84 percent and 87 percent Standard Proctor with the following exception:

1. Rake each lift smooth to break or remove clods, and fill low spots or voids.
2. Soil shall be scarified between lifts to prevent slickened faces occurring between soil lifts and profiles.
3. Rootball Pedestals: In those cases where the final soil profile depth exceeds the height of the plant rootball, the entire horticultural subsoil depth beneath the rootball shall be compacted to between 88 percent and 92 percent Standard Proctor to create a firm pedestal and prevent settlement of the rootball.
4. Compaction:
   a. All Soil Profiles:
      1) Compact each lift to between 84 percent and 87 percent Standard Proctor, measured by the nuclear density method. Contractor shall anticipate that soil placement alone, or moderate hand-tamping, will be sufficient to meet this value. Care shall be taken to not over compact soil. In all
cases, the moisture of the planting soil being placed shall not occur when soil moisture content is greater than 12 percent volumetric water content. Optimum moisture content for compaction shall not exceed 0.15 g/g as measured by the nuclear density method.

a) Compaction rate for completed soil profile, static cone penetrometer method:
   (1) 0 inch to 6 inch Depth: Range 60 psi to 100 psi.
   (2) 6 inch to 12 inch Depth: Range 80 psi to 120 psi.

b. After installation, perform in-situ soil density and double-ring infiltrometer tests in conformance with Part 1 of this Specification. Remediate any areas that exceed the specified compaction rate or that fail to drain within the specified rate. Remediation shall include de-compaction, aeration, or full replacement of the affected soil areas.
   1) Infiltration rate for Soil Profiles, Minimum: 0.5 inch per hour.

c. After compaction and testing, scarify each lift and/or soil horizon to prevent the formation of slickened faces. Depth of scarification shall be 2 inches.
   1) Do not scarify final lift of soil profile. At structural soil profile, install woven filter fabric as indicated on Drawings.

5. Prevention of over-compacted soils can be accomplished by beginning the Work in the center of planting area locations, against walls, or the center of isolated beds, and progressing outwards towards the borders.

3.07 PROTECTION AND REPAIRS

A. The Contractor shall take every precaution to ensure the integrity of the underdrainage, aeration and irrigation systems during and after soil placement. Any damage caused by the Landscape Contractor shall be repaired at no additional expense to the Owner.

B. The Contractor shall be responsible to ensure that no soil disturbance will occur from construction traffic or other construction activities after placement of planting soil mixes is complete. Disturbance shall be repaired by the Contractor at no additional expense to the Owner.

1. The Contractor shall place barricades to prevent compaction of planting soil mixes from vehicles, equipment, or pedestrian traffic.
2. Coordinate activities with other project contractors so that there is no soil disturbance from traffic or other construction activities subsequent to placement.
C. Protect newly graded areas from traffic and erosion. Keep free of trash, debris or construction materials from other work.

D. Repair and re-establish grades where completed or partially competed surfaces become eroded, rutted or compacted. Scarify, or, if directed by the Landscape Architect, remove and replace soil to a depth as directed by the Landscape Architect. Reshape and recompact at optimum moisture content to the required density.

E. Where settling occurs, before Final Acceptance or during the warranty period, remove finish surfacing, backfill with additional approved material, compact to specified rates, and restore any disturbed areas to a condition acceptable to the Landscape Architect.

3.08 EXCESS MATERIALS

A. Excess Planting Soil Mixes: Remove the excess planting soil mixture and materials from the project area at no additional cost to the Owner.

END OF SECTION
SECTION 32 92 01
PRAIRIES, MEADOWS, AND WETLANDS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. All of the Contract Documents, including General and Supplementary Conditions, and Division 01, General Requirements, apply to the work of this Section and are hereby made a part of this Section.

B. Examine all Drawings and other Sections of the Specifications for requirements therein affecting the work of this trade.

1.02 WORK OF THIS SECTION

A. The Work of this Section includes, but is not limited to:

1. Review of conditions and materials affecting planting.
2. Seeding meadow mix.
4. Establishment of meadow.
5. Management of meadow.
6. Coordination with other trades.
7. Testing.
8. Clean-up.
9. Restoring all planted areas within the limit of work or adjacent to the work area that are disturbed by the work of the Contract.

1.03 RELATED SECTIONS

A. Other Specification Sections which directly relate to the work of this Section include, but are not limited to, the following:

1. The following items of related work are specified and included in other Sections of the Specifications:
   a. Section 01 50 00, Temporary Facilities and Controls.
   b. Section 32 84 00, Landscape Irrigation.
   c. Section 32 91 13.19, Planting Soil System Procurement.
   d. Section 32 91 19.13, Planting Soil System Installation.
   e. Section 32 93 00, Planting and Fine Grading.
1.04 DEFINITIONS

A. Cover Crop: For the seed mix entitled “Meadow Mix – Seed” listed in the planting schedule within the Landscape Series Drawings, the species *Secale cereal* (Winter Rye) is the Cover Crop as noted in this Section.

B. Establishment Period: The time frame to complete a specific Planting Window (from start date to acceptance of final milestone activity), which if successful shall be Final Acceptance. The establishment period includes management activities including but not limited to watering, weeding, replanting, etc.

C. Planting Window: Range of time in which Milestone Activities occur, order of which is noted in Part 3 in this Section.

D. Final Acceptance: The time at which all Milestone Activities for a particular planting window have been performed and accepted by the Landscape Architect including any work noted on the “Punch List.” Warranty periods do not begin until Final Acceptance.

E. Management Period: Time frame that begins after the establishment period ends (as marked by Final Acceptance) within which the Contractor shall be required to complete management activities to ensure health of all plantings.

F. Milestone Activity: Critical step listed in the planting window that requires acceptance by the Landscape Architect prior to continuing to the next step.

G. Planting Window: Range of time and specific sequence of planting and maintenance activities.

H. Plug: A seedling raised in a manufactured soil mix in individual cells ready for transplanting.

I. Pure Live Seed (PLS): PLS is a means of expressing seed quality. PLS is the percentage of seed (i.e. good viable seed) that has the potential to germinate within a measured 1 pound weight of any seed lot, expressed in pounds per acre as the basis for the calculation of seeding rates.

1.05 SUBMITTALS

A. Product and Installation Data: Provide for each element of construction listed.

1. Meadow Mix Seed:
   a. Indicate certification of mix proportions, Pure Live Seed percentages, installation methods (including equipment), installation schedule, and viability date.
b. Installation methods (including equipment) and schedule.

2. Plugs: Provide photographs of the plugs at the source: overall pictures of plug trays, close up of four trays, and close up photographs of plugs pulled out of the trays and showing root condition.

3. Soil Tests to analyze poor performing meadow before Final Acceptance. Refer to Article Testing and Article Milestone and Final Acceptances of this Section. For soil tests required for soil manufacturing and installation of soil, refer to Section 32 91 13.19, Planting Soil System Procurement, and Section 32 91 19.13, Planting Soil System Installation.

B. Samples: Provide for each element of construction listed.

1. Meadow Mix Seed: Two pint bags of seed mix with seed mix label.
2. Sand: Two pint bags of sand to be used for mixing with seed mix for overseeding.

C. Seed Certification: Provide certification showing seed mix species and source. Certification shall clearly indicate deviations from the specified seed mix and any proposed substitutions.

D. Plug Certifications:

1. Plugs: Documentation of source and species identification.

E. Installer Qualifications:

1. Submit the following information for a minimum of three projects of a similar size and complexity:
   a. The project name, Client, General Contractor if applicable, dates of construction, cost of the project, contact information for the Owner/Client, the Architect/Landscape Architect, and the General Contractor if applicable.

F. Installer Certificates: In addition to requirements of Section 01 33 00, Submittals Procedures, provide information requested in this Section.

1.06 QUALITY ASSURANCE

A. Installer Qualifications:

1. Seed Installer: In addition to the requirements of Section 01 45 16.13, Contractor Quality Control, a qualified landscape installer whose work
has resulted in successful establishment of native grass meadows from seed on at least three projects of similar size and complexity.

2. Minimum experience for Foreman and Installer shall be 5 years.

B. Supplier Qualifications: Minimum 10 years providing material to be used under this scope of work.

C. Pre-installation Conference: A pre-installation conference with the Installer, Owner, Landscape Architect and Owner’s Representative is required for the work of this Section. Schedule pre-installation conference within 60 days of contract award or 30 days prior to the start of the work of this Section, whichever is sooner.

D. Inspection:

   1. The Landscape Architect shall have the right to reject any seed supplier if he/she determines, before, during or after inspecting or receipt of seed, any of the following:
      a. The seed and/or plug does not meet the quality standards set forth herein.
      b. The seed and/or plug supplier cannot supply the specified seed and/or plug or an acceptable substitute.
      c. The seed and/or plug supplier’s cultural practices or management procedures do not meet specified standards.

E. The Landscape Architect has endeavored to locate sources for the seed and plugs indicated. However, the Landscape Architect makes no claim that the materials will be available at the sources researched. The Contractor shall submit to the Landscape Architect any questions regarding the source of seed or plugs.

   1. Acceptable suppliers, or approved equivalent, include:
      a. GRASSLANDER
         Rt 1, Box 56
         Hennessey, OK 73742
         Telephone: (405) 853-2607
      b. Johnston Seed Company
         319 West Chestnut
         Enid, OK 73701
         Telephone: (800) 375-4613
      c. Kaw River Restoration Nurseries
         1269 N. 222nd
         Baldwin City, KS 66006
         Telephone: (785) 594-2245
1.07 DELIVERY, STORAGE AND HANDLING

A. In addition to the requirements of Section 01 61 00, Common Product Requirements, provide the following:

1. General:
   a. Deliver materials only after preparation for on-site seeding have been completed and accepted, including but not limited to: irrigation, rough grading, utilities, and planting soil placement.
   b. Prohibit vehicular and pedestrian traffic on or around areas to be seeded or plugged.

2. Seed:
   a. Seed shall be stored at temperatures between 40 degrees F and 60 degrees F and with a relative humidity of between 25 percent to 60 percent.
   b. Store seed in sealed bags in a dry location on raised palettes.
   c. Seed that has become wet or moldy shall not be accepted.
d. Transport: Temperature shall not exceed 105 degrees F at any time. If transit from cold storage to sowing is greater than 10 days, seed must be kept under storage temperatures and relative humidity described above.

3. Store plugs in original containers and protect from cold and heat. Do not allow plugs to dry out.

1.08 PROJECT CONDITIONS

A. Limits of Work: The limits of work for prairies, meadows and wetlands or as shown on Drawings. All areas beyond the limits of work that are disturbed shall be restored to the satisfaction of the Owner and Landscape Architect.

B. Lines and Grades:

1. The Contractor shall verify that the subgrade and finish grade lines and grade are consistent with the Drawings and acceptable to the Landscape Architect. The Contractor shall make adjustments as necessary to establish finish grades.

2. Grades: If present, protect and maintain grade stakes and location stakes until removal is acceptable to Landscape Architect and all parties involved in this project. If grade stakes are not present, establish grade stakes to ensure that grades shown on Drawings are being met.

C. Utilities: Determine and mark the location of below grade utilities before project staking. The Contractor shall field locate all utilities before starting work. Hand excavate as necessary to avoid damage. Repair all damage and restore items to their original condition as approved by the Landscape Architect and authorities having jurisdiction at no change in Contract Amount.

D. Concealed Conditions: Notify Construction Manager before planting when below grade conditions detrimental to proper plant growth are encountered.

E. If planting, soil, irrigation and hardscape work is underway during seeding, the contractor shall coordinate his/ her work with other Trades. The Contractor shall take care to avoid damaging any adjacent work or work beyond the limit of work. Should damage occur, the Contractor shall repair elements to the Landscape Architect’s satisfaction.

F. Sequence of Planting: Sequence installation so that trees and shrubs that are within seeded and or plugged areas are installed before prairies, meadows and wetland planting, unless otherwise approved by the Landscape Architect. Restore damaged prairies, meadows and wetlands if tree and shrub planting is delayed. Complete planting work as quickly as possible on portions of the site as they become available for planting.
G. Coordinate installation of seeded or plugged areas with installation of planting soils.

H. Verify that irrigation work is installed and available for watering at time of installation. Do not proceed with work until irrigation is available.

1. In the absence of the permanent irrigation system, verify that potable water is available. Provide all hoses and equipment to distribute water to area of landscape work and areas needing watering. See Division 01, General Requirements, for availability of water for irrigation. Provide water tank trucks if water service is interrupted. Prior to providing water tank trucks, submit to the Landscape Architect for approval. If water service is discontinued, for any reason, before Final Acceptance, provide water as needed to maintain seeded areas in healthy condition.

1.09 TESTING

A. General:

1. Soil testing is required at areas exhibiting unsatisfactory growth of seed for diagnostic purposes. Contractor shall be responsible for the costs of testing including sampling, testing, and retrieval and distribution of test results. Adhere to Landscape Architects recommended amendment(s) for unsatisfactory areas.

2. Landscape Architect shall determine which locations require soil testing.

3. Record-keeping Log for Testing: Maintain clear, concise records for all testing and sampling procedures. Log actives and results in the record-keeping log.

4. For soil testing procedures, refer to Section 32 91 13.19, Planting Soil System Procurement, and Section 32 91 19.13, Planting Soil System Installation.

1.10 PLANTING WINDOW

A. Refer to Article Planting Windows in Part 3 of this Section.

1.11 MILESTONE AND FINAL ACCEPTANCES

A. General:

1. Two types of acceptance are required for the meadow:
   a. Milestone Acceptance occurs as part of Article Planting Windows described in Part 3 of this Section.
b. Final Acceptance occurs after all Milestone Acceptances have been approved by the Landscape Architect and the meadow is established.

c. Partial acceptance will not be granted.

B. Acceptance Criteria: Acceptance criteria for the work of this Section are defined below. The Contractor shall over-seed unacceptable areas until acceptance criteria are satisfied and Final Acceptance is provided by the Landscape Architect.

1. Acceptance Criteria for Seeded and Plugged Meadow Mix:
   a. Create an acceptable stand of meadow, which is defined to mean a uniform coverage with well established, close stands of plants that meeting the following criteria:
      1) Minimum of 12 to 24 thriving grass plants per square foot.
      2) No bare or dead spots over 8-inch maximum in any dimension.
      3) No more than one bare spot for each square yard of planting.
      4) Free from weeds, disease, and detrimental insect infestation.
      5) Roots extending 6 inches into new root zone layer.

2. Management during Establishment Period: Begin management practices immediately after start of planting window. Length of time necessary for establishment shall not be limited. At Final Acceptance, the establishment period is concluded and the management period begins.

C. Prairie, Meadow and Wetland Maintenance During Establishment: Begin maintenance practices immediately after planting – and start of planting window. Length of time necessary for establishment shall not be limited.

1. Provide complete, organic maintenance and service as required to promote and maintain healthy growth including, without limitation, watering, and per the Landscape Architect’s specifications, weeding, invasive species removal, fallen leaf removal, treating for insects and disease, resetting plugs and other operations and maintenance work.

2. Hand-pull weeds on a weekly basis. Inform Landscape Architect of noxious weeds to determine method of eradication. Refer to Article Management Procedures and Activities, Paragraph High Priority Weed Control of this Section for a partial list of high priority common weeds and additional requirements.

3. Application of insecticides and herbicides is expressly prohibited. Confer with Landscape Architect for organic methods of controlling insect infestation or disease.
D. Request for Milestone Activity Acceptance: Make the request for Milestone Acceptance in writing at least 5 days in advance of preferred inspection date. Do not request inspection for acceptance until installation work for the activity is 100 percent complete and in compliance with the Contract requirements.

E. Request for Final Acceptance: Make the request for Final Acceptance in writing at least 10 days in advance of preferred inspection date. Do not request inspection for acceptance until installation work for the activity is 100 percent complete and in compliance with the Contract requirements.

1.12 WARRANTY

A. Provide written warranty agreeing to remove and replace work that exhibits defects in materials or workmanship for the specified periods. “Defects” is defined to include, but is not limited to, death, unsatisfactory growth, failure to adequately root into soil, disease, abnormal foliage density, abnormal size, abnormal color, failure to thrive, and other unsatisfactory characteristics.

B. Meadow Replacement: Replace defective meadow with new seeding that will provide plants of same type, species, character, and quality of originally accepted work. If a replacement is unacceptable during its one year warranty, the Contractor shall provide another replacement or, when approved by the Owner, equivalent cash payment.

1. Perform soil tests for soil biology, compaction, and infiltration to determine the reason for failure and correct any defects before replacing meadow. Refer to Section 32 91 13.19, Planting Soil System Procurement, and Section 32 91 19.13, Planting Soil System Installation, for soil testing. Provide as many tests as needed to determine cause for failure and evaluation of remediation measures taken.

2. Replacement Planting Seasons: Planting for replacement and warranty work for meadows shall comply with the planting windows specified herein.

C. Warranty Period for Meadows:

1. If Owner does not elect to hire Contractor for the management period activities, the warranty period shall start at Final Acceptance.

2. If the Owner elects to hire the Contractor for the management period activities, the warranty period shall start at the end of the management period.

3. Warranty period shall be 1 year after Final Acceptance.
4. Owner Responsibility and Warranty Exclusions:
   a. The Contractor’s warranty shall exclude problems due to improper or inadequate management, vandalism, or acts of nature.
      1) During the warranty period, the Contractor shall visit the site at least three times during the growing seasons to review the conditions of the accepted work. The Contractor shall submit in writing to the Owner regarding the Owner’s management practices and/or any vandalism. The content of this notice shall include a list of specific plants involved, the presumed problem, and a method of remedy for the problem(s) cited. The Owner shall make reasonable efforts to correct the problems cited by the Contractor’s defects in materials or workmanship that resulted in decline or death to plants.
      2) Failure of the Contractor to make the required reviews of the site during the warranty period and to submit written notice to the Owner of the management defects shall negate the Contractor’s ability to make a claim against the Owner for negligence of management.

1.13 MANAGEMENT PERIOD

A. As an option to the Owner, the Contractor shall maintain the meadow planting for a period of 1 year following Final Acceptance. Management activities shall be on a bi-weekly basis and are described in Part 3 of this Section.

PART 2 PRODUCTS

2.01 PLANTING SOIL

A. Refer to Section 32 91 13.19, Planting Soil System Procurement, for planting soil materials and handling requirements.

B. Coordinate installation of soil mixes and plants to meet requirements of Section 32 91 13.19, Planting Soil System Procurement, and Section 32 91 19.13, Planting Soil System Installation.

2.02 MEADOW MIX SEED

A. General: Provide fresh, new crop seed that is 98 percent pure live seed or better. In no case shall weed seed content exceed 1 percent by weight. All seed shall comply with Federal and State seed laws. Seed shall not be coated with herbicides and/or fungicides.
B. Seed Mix: See Drawings.
   1. Cover crop seed is incorporated into the meadow mix seed as noted on Drawings.
C. Seeding Rate: 225 pounds per acre unless otherwise indicated on Drawings or in approved submittals.
D. Species list are shown on Drawings.
E. See planting window for specific times for seeding of meadow.

2.03 PLUGS
A. Plugs: Custom-grown plants that shall be typical of their species or variety and exhibiting normal habit of growth and vigorous root development.
   1. Provide plugs in 50-cell packs (1-3/4-inch width by 2-1/4-inch depth) unless otherwise indicated on Drawings. Height of vegetation above basal collar shall be 12 inches at the time of installation, unless written acceptance is provided by the Landscape Architect prior to planting. If plugs are undersized, Contractor shall provide an additional 25 percent of total quantity specified for each species.
   2. Plant species to be installed are listed on Drawings.
   3. Plants shall be legibly tagged with the proper name.

2.04 HYDROGEL FOR PLUGS
A. Provide Hydrogel from a Single Source: STOCKOSORB 600 for dip, powder form as manufactured by Evonik Corporation, 3606 Highway 44, Garyville, LA 70051.

2.05 SAND FOR TOPDRESSING
A. Provide sand that complies with ASTM C33.

2.06 SOIL AMENDMENTS
A. Soil amendments shall not be used for meadow plantings. Prohibited amendments include Liquide Biological Amendment, granular humates, feather meal, and organic fertilizer or any other amendment no listed herein.
2.07 MISCELLANEOUS MATERIALS

A. Soil and Pavement Protection: The driving of vehicles over planted areas is expressly prohibited.

1. Protect pavements using one of the following:
   a. Plywood: Provide 3/4-inch Grade C or better plywood for use as planking when driving vehicles or moving equipment over areas to be planted.
   b. Oriented Strand Board (OSB): Two layers of 3/4-inch OSB on top of 6-inch mulch. Provide Filter Fabric under mulch layer.

PART 3 EXECUTION

3.01 EXAMINATION

A. Pre-Installation Examination Required:

1. Before beginning any planting window, the Contractor shall examine previous work, related work, and conditions under which this work is to be performed and notify the Landscape Architect in writing of all deficiencies and conditions detrimental to the proper completion of this work. Beginning work means Contractor accepts substrates, previous work, and conditions. The Contractor shall not commence work associated with the installation of Meadows until all work in the work areas is complete and accepted by the Landscape Architect. The Contractor shall confirm that:
   a. Planting soil is installed and has been accepted.
   b. Fine grading is accepted and remains free of debris.
   c. Area is free of weeds.
   d. Landscape surface and subdrainage systems are installed and accepted.
   e. Utilities have been installed and accepted.
   f. Permanent and Temporary Irrigation has been installed and accepted.
   g. Verify that irrigation system can be activated. If not, verify that sufficient means for on-site watering of installed seed is available.

3.02 PLANTING SOIL PLACEMENT

A. See Section 32 91 19.13, Planting Soil System Installation, for execution requirements.
3.03 PRAIRIE, MEADOW AND WETLAND SEEDING

A. Prairies, Meadows, and Wetland Seeding:

1. Seeding: Seed only when areas are in a friable condition and neither hard nor muddy, after the planting areas have been prepared and treated, as described herein. Do not seed in windy weather. Uniformly seed areas in two directions at right angles to each other for planting using a hand spreader or other approved method.

2. Verify with the Landscape Architect the extent and distribution of seeding and/or plugs. Stake out areas with wood stakes and survey lines and provide labeled 4-foot high wood stakes that identify seed/plug type for each area.
   a. Do Not proceed with installation until layout and distribution has been accepted by the Landscape Architect.

3. All newly seeded and plugged areas will receive 0.25 inches of water per day for the first 10 days to prevent germinating seeds from drying out. Thereafter, a deep watering to maintain soil moisture to at least 6 inches every week for the next 2 months. This will require a 1-inch irrigation event every week or twice a week under hot dry conditions. For the remainder of the growing season, there should be a minimum watering of 1 inch every 2 weeks.

4. Irrigation should occur during times when water loss from evaporation is lowest, but without potentially creating a disease prone environment. Irrigation should not occur after a sufficient rain event or when otherwise unnecessary. Use watering regimes that prevent erosion.

5. Planting season for seed shall be as indicated herein. The actual planting of seed shall be done; however, only during periods within this season that are normal for such work as determined by weather conditions and by accepted practice in this locality. At their option and on their responsibility the Contractor may plant seed under unseasonable conditions without additional compensation.

6. Only experience workers under the supervision of a qualified foreman shall do seeding. Seeding shall consist of soil preparation, seed drilling, rolling, pegging, weeding, watering and otherwise providing all labor and materials necessary to secure the establishment of acceptable vegetative layer.

7. Seed only when areas are in a friable condition and neither hard, muddy, excessively wet or frozen.

8. Prior to seeding, dampen surface of soil to 1.5 inches with potable water meeting the requirements of water quality listed in this specification.

9. Do not seed when wind velocity exceeds 5 mph.

10. Prior to seeding, seed mix should be mixed with sand.
    a. Ratio of mix (by volume) shall be 10 parts sand to 1 part seed.
11. Hydraulic mulch seeding is not allowed.
12. Adhere to planting installation dates as defined in Part 1 of this Section.

3.04 PRAIRIE, MEADOW, AND WETLAND PLUGS

A. Install meadow seed mix during the timeline established by the planting windows specified in Article Planting Windows in Part 3 of this Section.

B. Contractor shall minimize foot traffic for trimming and the installation of the plugs. Before beginning work, the Contractor shall discuss the method of minimizing disturbance with the Landscape Architect.

C. Planting Plugs: Plantings shall be made according to the location indicated on Drawings, and shall consist of species as indicated on Drawings. Landscape Architect shall review the installation of the plugs.

1. Dip plug roots into hydrated hydrogel mix. Ensure even coating. Strictly follow manufacturer’s instructions for dipping plug roots.
2. Install the plug so the stem base is at or slightly above finish grade.
3. Install plugs to their full depth without bending the plug. Plugs demonstrating “J-Roots” within cell-packs shall not be acceptable.
4. Backfill planting holes and tamp the soil around each plug in place so that it is firmly seated in the soil, with no air pockets.
5. Unless otherwise indicated on Drawings, plugs shall be planted 12 inches on center.

3.05 PLANTING WINDOWS

A. General: Planting window for meadow seed shall be as described in this Article of the Specification. The actual planting, however, shall be done only during periods within the season that are normal for such work as determined by weather conditions, moisture content of the soil, and by accepted practice in this locality.

B. Prior to seeding verify meadow area is prepared and ready for vegetation installation. Review area with Landscape Architect before beginning work.

1. Removal all weeds from meadow prior to start of any planting window.
2. Fine grading has been accepted by Landscape Architect.
3. Water is available for establishment.

C. Each step listed for each planting window is a Milestone Activity that cannot be started until approval is given by the Landscape Architect. See Article Acceptance Criteria in Part 1 of this Section.
D. During each planting window, the Contractor shall perform management activities as described in other parts of this Section.

1. Weeds shall not exceed 8 inches in height during the establishment period.
2. If Meadow Seed mix is installed between February 15 and March 15, the cover crop shall be cut back to 4 inches prior to April 1, avoiding seedling growth.

E. Soil to receive seed or plugs shall be weed free at the start of each milestone activity. The Contractor shall remove weeds from the site by one of the pre-approved methods described in this Section.

F. Planting Windows: Contractor shall review planting windows outline below, and based upon completion date of final grading, determine which Planting Window shall be followed. Completion of any one planting window is required. Prior to starting the Planting Window, verify selected Window, and review procedure with Landscape Architect.

1. Planting Window 1:
   a. Milestone 1: Fine Grading is completed between November 1 – February 15.
      1) No Planting allowed.
      2) Evenly Spread 2-inch thick profile of compost over entire meadow.
   b. Milestone 2: Till in compost to top 3 inches to 4 inches of gravel soil profile (February 15 – February 28).
   c. Milestone 3: Install Meadow Seed (February 15 – March 15).
   d. Milestone 4: Cut back Cover Crop to 4 inches, avoiding seedling growth (March 15 – April 1).
   e. Milestone 5: Install Plugs (May 1 – June 1)
   f. Request Acceptance. See Article Acceptance Criteria in Part 1 of this Section.
   g. After receiving acceptance, immediately begin management procedures and activities per Article Management Procedures and Activities outlined in Part 3 of this Section.

2. Planting Window 2:
   a. Milestone 1: Fine Grading is completed between February 15 and October 31.
   b. Milestone 2: Install Meadow Seed (February 15 – July 15).
c. Milestone 3: Cut back Cover Crop to 4 inches, avoiding seedling growth (March 15 – April 1).
   1) If meadow seed is installed after April 1 or the soil temperatures average 65 degrees over a 1 week observation period, cover crop cut back is not necessary.

d. Milestone 4: Install Plugs (May 1 – June 1).

e. Request Acceptance. See Article Acceptance Criteria in Part 1 of this Section.

f. After receiving acceptance, immediately begin management procedures and activities per Article Management Procedures and Activities outlined in Part 3 of this Section.

3. Planting Window 3:

a. Milestone 1: Fine Grading is completed between July 15 and August 31.
   1) No Planting allowed.
   2) Evenly spread 2-inch thick profile of compost over entire meadow.

b. Milestone 2: Till in compost to top 3 inches to 4 inches of gravel soil provide (July 15 – August 31).

c. Milestone 3: Install plugs for entire site, after which, Install Meadow Seed (September 1 – September 30 for plugs, September 1 - November 1 for seed).

d. Request Acceptance. See Article Acceptance Criteria in Part 1 of this Section.

e. After receiving acceptance, immediately begin management procedures and activities per Article Management Procedures and Activities outlined in Part 3 of this Section.

3.06 MANAGEMENT PROCEDURES AND ACTIVITIES

A. General: At the start of the management procedures and activities, conduct biweekly meadow inspections with the Landscape Architect and Owner (February 15 – November 1) to review the progress of the meadow. Discuss “look-ahead” schedule and determine, what, if any, actions need to be taken.

   1. Maintain observations and discussions in a Management Log.

B. Management Log:

   1. At each visit to the site, record the following items:
      a. Date and time of visit.
      b. Attendees.
      c. Weather.
d. Indicate high priority species and planned date for removal.
   1) Landscape Architect and Owner will provide aggressive species list at the start of the Management Period. See Article Management Procedures and Activities, Paragraph High Priority Weed Control of this Section for preliminary high priority weed species list.

e. List management activities performed and diagrammatically map where each activity occurred and locations of weed species.

f. Record discussion in the form of action items and list responsible party.
   1) Submit up to date Management Log to the Owner and Landscape Architect on the last day of each month.

C. Erosion Control: For soil left bare prior to seeding, refer to Section 32 91 19.13, Planting Soil System Installation.

D. Watering:

1. General:
   a. The Contractor shall provide all labor and arrange for all watering necessary to establish an acceptable final meadow.
   b. Irrigate as required to promote growth. Maintain proper soil moisture to germinate seeds. Maintain proper soil moisture post emergence.
   c. Irrigation shall occur during times when water loss from evaporation is lowest, but without potentially creating a disease prone environment. Irrigation should not occur after a sufficient rain event or when otherwise unnecessary. Use watering regimes that prevent erosion. Monitor soil moisture to ensure that grass seedlings are not overwatered.
   d. Watering shall be done in a manner which will provide uniform coverage, prevent erosion due to application of excessive quantities over small areas, and prevent damage to the finished surface by the watering equipment. The Contractor shall furnish sufficient watering equipment to apply one complete coverage to the seeded areas in an 8-hour period.
   e. Meadow Mix: All newly seeded areas shall receive 0.25 inches of water per day for the first 15 days to prevent germinating seeds from drying out. For the next 2 months a deep watering three times per week to maintain soil moisture to at least 6 inches shall be performed.

2. Temporary Irrigation System: This Project anticipates fixed irrigation. Should the project description change, a temporary irrigation system
shall include above ground piping and spray heads or misters that can easily be removed after establishment.

a. Contractor shall design system for complete meadow coverage and certify that the application rate meets the requirements listed as part of this article. Submit design to Landscape Architect for approval.

E. General Weed Control:

1. General:
   a. For weeding techniques (cutting, trimming, pulling) see Appendix A.
   b. Cut or trim weeds to the height in accordance with the Management Period as described in Part 3.
      1) Weeds shall never exceed 12 inches in height during the management period.
   c. Weed species shall never be allowed to set seed.
      1) Should a weed set seed, place a plastic bag over the weed and cut the weed at its base. Turn over the bag with the weed inside. Dispose of the bag and weed. Review procedure with Landscape Architect at the start of maintenance operations.
   d. After cutting or trimming, remove all cut down plants from the site. Do not compost the waste plant material.
   e. Do not trim when plants are wet. This makes debris removal more difficult.
   f. Overseeding of the meadow can occur between February 15 – October 31. Top-dress may include the whole meadow or patches. This work will be required as indicated by the acceptance criteria outlined in Article Milestone and Final Acceptances, Paragraph Acceptance Criteria in Part 1 of this Section.

F. High Priority Weed Control:

1. Selectively cut or trim aggressive weed plants from the meadow on a bi-weekly basis. The following weeds are aggressive species; however, the final list shall be finalized by the Landscape Architect and provided to the Contractor at the start of the Management Period:
   a. Alliaria officinalis, Garlic Mustard.
   b. Artemesia vulgaris, Mugwort.
   c. Celastrus orbiculatus, Oriental Bittersweet.
   d. Cirsium arvense, Canada Thistle.
   e. Cyerus esculentus, Yellow Nutsedge.
   f. Daucus carota, Queen Anne’s Lace.
g. *Fallopia japonica*, Japanese Knotweed.

h. *Lythrum salicaria*, Purple Loosestrife.

i. *Melilotus sp.*, Sweet Clover sp.

k. *Phalaris arundinacea*, Reed Canary Grass.

m. *Solanum carolinense*, Horsenettle.

n. *Vitis sp.*, Wild Grape.

G. Use of Herbicides: No herbicide of any kind can be used on this Project.

H. Repair of Meadows:

1. If meadow is damaged, remove damaged materials if necessary. Reestablish meadow (and soil horizons) as originally installed following the planting window time frames. Request Landscape Architect approval prior to beginning repairs.

2. If meadow exhibits unsatisfactory growth, perform soil testing for chemical properties, compaction and infiltration rates. Adhere to Landscape Architect’s recommended remediation. Remediation may include soil additives or Topdressing.

I. Topdressing:

1. Topdressing shall be performed at the request of the Landscape Architect. Topdressing shall be required if meadow establishment/performance is poor, dead spots are apparent, or other unsuitable conditions are present.

2. Topdressing shall be performed March 1 – May 1 and September 1 – October 15. Work outside this window is not permitted.

3. Cut or trim vegetation to maximum of 4 inches prior to topdressing. Remove cut vegetation from the meadow.

4. Irrigate meadow just prior to Topdressing so that moisture reaches to at least 6 inches below grade.

5. Apply sand/seed mixture to a depth of 1/4-inch across the area to be treated.

   a. Sand shall comply with ASTM C33 for mechanical gradation. Sand shall be wet at the time of mixing and during application. Mist dry sand with hose as necessary prior to mixing.

   b. Seed shall be the approved meadow seed mix.

      1) Ratio of mix (by volume) shall be 10 parts sand to 1 part seed.
J. Management Period (1 Year):

1. At no more than 12 inches, all weeds are to be cut back or pulled (species dependent).
2. Contractor shall be responsible for at least four weeding (June, July, August, and September). Rate of growth shall dictate number of cuttings.
3. End of Season Cutting: Cut back all meadow growth for the season to 4-inch to 6-inch between November 30 – December 15.
4. Overseed meadow following end of season cutting using the specified, submitted and approved seed mix(es).

3.07 CLEANUP, PROTECTION AND EXCESS MATERIALS

A. Store materials and equipment remaining on site in locations which do not interfere with construction operations or management activities.

B. The Contractor shall be responsible for keeping all paving surfaces clean during placement of seeding, sodding and plugging operations. Remove equipment from the site promptly when no longer in use.

C. Provide temporary protection to ensure work is without damage or deterioration after installation.

D. Protection of Drainage System: Protect existing drainage protection system at all drain inlets to prevent silt, materials or debris caused by planting operations from entering the drainage system.

END OF SECTION
SECTION 32 93 00
PLANTING AND FINE GRADING

PART 1     GENERAL

1.01 RELATED DOCUMENTS
   A. All of the Contract Documents, including General and Supplementary
      Conditions, and Division 01, General Requirements, apply to the work of this
      Section and are hereby made a part of this Section.
   B. Examine all Drawings and all other Sections of the Specifications for
      requirements therein affecting the work of this trade.

1.02 WORK OF THIS SECTION
   A. The work of this Section includes, but is not limited to:
      1. Woody plants, balled, and burlapped and containerized.
      2. Herbaceous plants, pots and plugs.
      3. Liquid biological amendments.
      4. Plant anchoring systems.
      5. Post-installation maintenance.
      6. Coordination with other trades.
      7. Warranty and maintenance.
      8. Temporary erosion control.
     10. Clean up.
   B. Extent of Landscaping Work: In addition to the work indicated, Landscape
      work includes restoring all areas within the limit of work disturbed by work of
      the Contract and coordination of work with other subcontractors.

1.03 RELATED SECTIONS
   A. The following items of related work are specified and included in other
      Sections of the Specifications:
      1. Section 01 33 00, Submittal Procedures.
      2. Section 01 50 00, Temporary Facilities and Controls.
      3. Section 31 23 16, Excavation.
      4. Section 31 23 23, Fill and Backfill.
      5. Section 31 32 19.16, Geotextile.
      6. Section 31 37 00, Riprap.
7. Section 32 84 00, Landscape Irrigation.
8. Section 32 91 13.19, Planting Soil System Procurement.
10. Section 32 92 01, Prairies, Meadows, and Wetlands.

1.04 REFERENCES

B. Standardized Plant Names, American Joint Committee on Horticultural Nomenclature, latest edition.

1.05 APPLICABLE STANDARDS

A. The references listed herein shall be the standards used for the Work, unless noted otherwise:

1. All standards shall include the latest additions and amendments as of the date of advertisement for bids.

B. American National Standards for Tree Care Operations, ANSI A300.
   American National Standards Institute, 11 West 42nd Street, New York, NY 10036.

1.06 DEFINITIONS

A. Balled and Burlapped Stock (B&B): Exterior plants dug with firm, natural balls of earth in which they are grown; wrapped, tied, rigidly supported, drum-laced and sized as recommended by ANSI Z60.1.

B. Containerized or Container-Grown Stock: Healthy, vigorous, well-rooted exterior plants grown in a container with well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold rootball shape and protect root mass during shipping and shall be sized according to ANSI Z60.1 for kind, type, and size of exterior plant required.

C. Final Acceptance: Date at which all Work, including work identified in the "Punch List," is completed and accepted by the Landscape Architect. Warranty periods do not begin until Final Acceptance.
D. Finish Grade: Elevation of finished fine graded surface of planting soil.

E. Girdling Root: A root that has become wrapped around the trunk of the plant that over time will inhibit the uptake of nutrients and produce structural failure, eventually leading to death of the plant.

F. Long Term Storage (of Plants): Equal to a period of 3 weeks or more after digging of the plants at the nursery, or a period of 1 week or more after receipt of plants at the Project Site.

G. Planting Soil for Soil Profiles: Soil produced on-site or off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil. See Section 32 91 19.13, Planting Soil System Installation.

H. Plugs: A seedling raised in a manufactured soil mix in individual cells ready for transplanting.

I. Root Flare: Also referred to as trunk flare, root crown, or root collar. The transition zone between the main stem and the root system, visible as the outwardly curving base of a tree where it joins the roots, often distinguishable as individual root buttresses.

J. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soil.

K. Tagging/Tagged/Tag: The Landscape Architect’s selection of plant material at the nursery. An individually numbered seal is placed on the north-facing branches of a tagged plant.

1.07 ACTION SUBMITTALS

A. Product Data: Provide for each element of construction listed.
   1. Plant anchoring systems.
   2. Natural burlap.

B. Samples: Provide for each element of construction listed.
   1. Tree stakes.
   2. Arbor ties.
   3. Plant anchoring system, all components.
C. Installer Qualifications: In addition to requirements of Section 01 33 00, Submittal Procedures, provide qualifications for the Project Manager and Foreman/Site Supervisor showing years of experience, and a minimum of three project references. For each reference list client, design or engineering professional hired by the client, type, cost and duration of project and role of personnel.

D. Planting Schedule: Indicating anticipated planting dates for performing all Work within this Section, coordinated with the Project. Coordinate and incorporate work in Section 32 91 19.13, Planting Soil System Installation, and Section 32 84 00, Landscape Irrigation.

E. Plant Species and Source List: The Contractor shall submit for approval plant species and source list indicating the plant botanical and common name, size, quantity, form, rootball, identification of fall dig hazards, limb height (if applicable), nursery source, including contact information, and Landscape Architect’s seal number.

1. Plant list shall clearly indicate deviations from the specified plant list and any proposed substitutions.
2. Contractor shall confirm nursery source prior to scheduling tagging trip.
3. As the project progresses and plants are located and sealed, revise and resubmit the plant list submittal.

F. Photographs of Plants taken at the Nursery Source: Provide representative images of plants prior to scheduling tagging trips and as the basis for the Landscape Architect to select plants.

1. Contractor shall label each photograph with the plant species botanical name, nursery name, and date of photograph.
2. Photographs shall include images showing the full range of characteristics of each plant, including detailed photographs of the bark, the base of the tree (rootball crown), leaves if present, branching structure, form, and habit.
3. Images shall include a scale figure or measuring device to indicate true size.
4. Photographs may be transmitted electronically but the title of electronic files must bear the plant name, nursery, and date.
5. For container plants, also provide close up photographs of the rootball with the container removed.
   a. Quantity: 10 percent of the total number specified.
1.08 INFORMATIONAL SUBMITTALS

A. Periodic Construction Images:
   1. In addition to the requirements in Section 01 32 00, Construction Progress Documentation, provide the following images:
      a. Rootball immediately prior to backfill.
         1) Frequency: During planting operations, provide images of a half-dozen trees two times a week during planting activities.

B. Plant Species and Source List: As the project progresses and plants are located and sealed, revise and re-submit the plant source list submittal. The Contractor shall maintain an up-to-date plant species and source list indicating the plant botanical and common name, size, quantity, form, rootball, identification of fall dig hazards, limb height (if applicable), nursery source, including contact information, and Landscape Architect’s seal number.

C. Planting Schedule Updates: As the project progresses, resubmit approved planting schedule updated to indicate anticipated planting dates for performing all Work within this Section, coordinated with the Project. Coordinate and incorporate work in Section 32 91 19.13, Planting Soil System Installation, and Section 32 84 00, Landscape Irrigation.

1.09 QUALITY ASSURANCE

A. Pre-installation Conference: A pre-installation conference with the Landscape Architect is required for the work of this Section.

B. Installer Qualifications:
   1. In addition to the requirements of Section 01 45 16.13, Contractor Quality Control, provide the following:
      a. The Contractor shall have been in business a minimum of 2 years.
      b. The Contractor’s record of successful in-service performance shall include the installation of manufactured planting soils similar to the specification in Section 32 91 19.13, Planting Soil System Installation.
      c. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when planting is in progress. Field Supervisor shall have a minimum of 5 years’ experience.
C. Labeling: Label at least one specimen of each variety and size with a securely attached, waterproof tag bearing legible designation of botanical and common name in compliance with the recommendations of the American Nursery & Landscape Association.

D. Tree and Shrub Measurements: Measure according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip-to-tip.

E. Pruning: Unless otherwise noted, pruning of plants before, during or after installation shall be prohibited except to remove dead or broken branches and limbs. Confer with the Landscape Architect before any pruning.

1. Pruning plants after the Landscape Architect’s selection and prior to delivery to the site shall be cause for rejection.

1.10 PROJECT CONDITIONS AND COORDINATION

A. Utilities: The Contractor shall locate and verify all existing and new underground utilities including subdrainage, before project staking and planting. Report any conflicts to Construction Manager. Hand excavate as necessary to avoid damage to ungrounded utilities.

B. Concealed Conditions: Notify Landscape Architect before planting when below grade conditions detrimental to proper plant growth are encountered. Do not proceed with planting without specific written instructions from the Landscape Architect.

C. Sequence of Planting: Plant trees and shrubs after finish grades are established and before planting prairies or meadows, unless otherwise approved by the Landscape Architect. Complete landscaping work as quickly as possible on portions of the site as they become available for landscaping.

1. If the Contractor is permitted by the Landscape Architect to plant trees and shrubs after prairies meadows, protect these areas and promptly repair damage caused by planting operations.
D. Planting Seasons and Weather Restrictions:

1. Work only within seasonal limitations for proper planting noted below. The Contractor shall, however, take into consideration seasonal weather conditions that would affect the planting period and shall not proceed if planting in these conditions would affect the short and/or long term health of the plants:

<table>
<thead>
<tr>
<th>Item</th>
<th>Spring Season</th>
<th>Fall / Winter Season</th>
</tr>
</thead>
<tbody>
<tr>

</table>

2. Regardless of the specified planting season dates, suspend work when the temperature is below 25 degrees F, the wind velocity is over 25 mph, the ground or planting soil is frozen or wet, or the continuation of prevailing weather will damage plant materials, including sustained periods of above-normal high temperatures. Complete planting operations as early in the specified season as possible.

E. Fall Dig Hazard: Some species of trees and shrubs are considered “Fall Transplanting Hazards” by the nursery trade. The Contractor shall identify Fall Transplanting Hazards from the plant schedule, and factor the proper handling of these trees into the overall sequencing of construction and Project schedule. The Contractor shall notify the Landscape Architect of any conflicts arising from this analysis of the plant list and schedule.

F. Water:

1. Water shall be tested for presence of chloramine. If levels are determined to exceed acceptable levels, provide an alternate source for water.

2. Water connections may be available on site. The Contractor shall immediately notify the Construction Manager and Landscape Architect in writing if water is insufficient for work and maintenance operations.
3. Provide water as needed from sources free from impurities injurious to vegetation.
4. Provide all hoses and equipment as needed to distribute water to area of landscape work and areas needing watering. Provide water tank trucks if water service is interrupted. Prior to providing water tank trucks, submit to Landscape Architect for review and approval.
5. The Contractor shall employ conservation practices for all water use and shall instruct all of his/her installers to abide by this requirement.

G. Painting: Do not paint vegetation for any reason.

1.11 ACCEPTANCE AND MAINTENANCE

A. Request for Acceptance: In writing, request Landscape Architect’s inspection for acceptance at least 10 days in advance of preferred inspection date. Do not request inspection for acceptance until work is 100 percent complete (not including maintenance) and in compliance with the Contract requirements.

1. Final Acceptance is defined as the time at which 100 percent of the work has been performed and accepted by the Landscape Architect (excluding post project maintenance) including any work noted on the “Punch List.”

2. Partial Acceptance: Acceptance of partial areas or portions of the total work may be granted, at the Landscape Architect’s option, if the area to be inspected for acceptance is large, well defined, and easily described. The Landscape Architect is not obligated to provide partial acceptance of the work.

B. Maintenance Period: Completely maintain plants and trees from date of receipt from nursery until 60 days after Final Acceptance.

1. Plant and Tree Maintenance: Provide complete maintenance and service as required to promote and maintain healthy growth including, without limitation, watering, weeding, fallen leaf removal, treatment for insects and disease, resetting plants to proper grade and upright position, and other operations and maintenance work. Throughout the maintenance period, restore planting saucers. Tighten and adjust rootball fixing system to keep trees in vertical position.

   a. Watering: Flood all plants during the construction and maintenance periods at least twice each week. If present and operational, coordinate programming of irrigation system to meet watering needs. If irrigation system is not operational, provide hand watering as needed to maintain healthy growth. At each watering, thoroughly saturate the soil around each tree and shrub.
If sufficient moisture is retained in the soil as determined by the Landscape Architect, the required watering may be reduced. Trees will require a minimum of 20 gallons of water for each watering. Shrubs will require a minimum of ten gallons of water for each watering.

1) Lack of adequate soil moisture is often a major cause of winter damage. All plants, but especially narrow leaf and broadleaf evergreens, use water during winter. Moisture must be available below the frost line or frozen soil.
   a) Plants should be watered thoroughly in the fall to prepare them for the winter months.
   b) During dry winters, broadleaf evergreens should be watered about once each month.

b. Application of insecticides and herbicides is expressly prohibited. Confer with Landscape Architect for organic methods of controlling insect infestation or disease.

1.12 WARRANTY

A. Warranty: Provide written warranty agreeing to remove and replace work that exhibits defects in materials or workmanship for the specified periods. "Defects" is defined to include death, unsatisfactory growth, disease, insect infestation, abnormal foliage density, abnormal size, abnormal color, failure to thrive, and other unsatisfactory characteristics.

1. Warranty Period: Two years from date of Final Acceptance.
2. If the Contractor disagrees with the planting practices herein specified, he/she shall state them in writing at least 60 days before planting work commences. Failure to present this written notice shall be interpreted as acceptance of the planting practices specified herein.
3. Replacement: Replace defective work with new material of same species, size, character, and quality of originally accepted work. With each replacement material, provide a new 1-year warranty for the replacement work. If a replacement is unacceptable during this second 1-year warranty period, the Contractor shall provide another replacement or, when approved by the Owner, equivalent cash payment.
4. Replacement Planting Seasons: The replacement period for plant warranty work shall comply with the Planting Seasons specified herein. Electing to plant outside of the specified Planting Seasons shall not absolve the Contractor from providing the warranty.
5. Repair of Adjacent Work After Warranty Replacement: Contractor shall return all adjacent elements and systems modified during removal and replacement of plants to the condition in which they were found, including shrub and perennial planting, planting soils and drainage.
6. Owner’s Responsibility and Warranty Exclusions: The Contractor’s warranty shall exclude problems due to improper or inadequate maintenance, vandalism or acts of nature.
   a. During the warranty period, the Contractor shall visit the site at least every other month to review the conditions of the accepted work. The Contractor shall submit in writing to the Owner regarding the Owner’s maintenance practices and/or any vandalism. The content of this notice shall include a list of specific plants involved, the presumed problem, and a method of remedy for the problem(s) cited. The Owner shall make reasonable efforts to correct the problems cited by the Contractor, but the Owner shall not be held responsible for the Contractor’s defects in materials or workmanship that result in decline or death to plants.
   b. Failure of the Contractor to make the required reviews of the site during the warranty period and to submit written notice to the Owner of maintenance defects shall negate the Contractor’s ability to make a claim against the Owner for negligence of maintenance.

PART 2   PRODUCTS

2.01   PLANT MATERIALS - GENERAL

A. General: Furnish specimen nursery-grown plants of genus, species, and cultivar specified complying with ANSI Z60.1, with healthy root systems well provided with fibrous roots developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects, such as knots, sun scald, injuries, abrasions, and disfigurement. All parts of the plant shall be moist and show active green cambium when cut. Plants will be densely foliated when in leaf.

B. Grade: Provide plants of specified height, caliper, sizes and grades complying with ANSI Z60.1 for type of plants required.

1. Larger Stock: Plants larger than required may be used if approved by the Landscape Architect if rootball is proportionately larger, and if there is no change in Contract Price.
2. Undersize Stock: If approved by the Landscape Architect, plants may be undersized as long as not more than 10 percent of plants smaller than required are used. If more than 10 percent undersized plants are used, then and 25 percent of the undersized plants shall be provided at no additional expense to the Owner.
C. Hardiness: Provide plant stock certified to have been grown within hardiness Zones 2 through 6 as established by the USDA’s Plant Hardiness Zone Map. Submit certification if so requested by the Landscape Architect.

D. Plant Character: All plants shall be typical of their species or variety and shall have a normal habit of growth and be legibly tagged with the proper name. Form and size shall comply with ANSI Z60.1.

1. Canopy Trees: Well-defined trunk flare, straight trunk, and single stem. Co-dominant leaders shall not be accepted. Evidence of equal increments of growth over the prior three seasons shall be discernible.
2. Multistem Trees: Branched or pruned naturally according to species and type, with relationship of caliper, height, and branching according to ANSI Z60.1.
3. Shrubs: Multi-stemmed plants complying with ANSI Z60.1 for the species indicated.
4. Groundcover: Provide groundcover of species indicated, established and well rooted in pots or similar containers, and complying with ANSI Z60.1.
5. Herbaceous Plants: Provide healthy plants from a commercial nursery, of species and variety shown or listed.
   a. Upon award of Bid, the Contractor shall arrange for all species or quantities of species require contract growing.
6. Herbaceous Plugs: All plants shall be typical of their species or variety and shall have a normal habit of growth.
   a. Provide fully rooted with a diameter of 1.5 inches, and a depth of 2.5 inches.

E. Trunk: The height of the trees shall be in accordance with ANSI Z60.1. No part of the trunk shall be conspicuously crooked as compared with normal trees of the same variety, for example ‘S’ curves shall not be allowed. The trunk shall be free from sunscald, frost cracks, or wounds resulting from abrasions, fire or other causes. No pruning wounds shall be present having a diameter exceeding 1 inch and such wounds must show vigorous bark on all edges.
ZINK DAM IMPROVEMENTS

F. Rootballs:

1. General:
   a. The diameter and depth of rootballs shall be sufficient to encompass the fibrous and root feeding system necessary for the healthy development of the plant in accordance with ANSI Z60.1., or the minimum rootball diameter shown, whichever is larger.
   1) If the root flare is buried 2 inches or more, provide a larger diameter or greater depth rootball to compensate for the buried root flare, as the soil overburden shall be removed prior to planting, which effectively reduces the size of the rootball.
      a) No plant will be accepted when the ball of earth surrounding its roots has been cracked or broken prior to or during the process of planting or after the burlap, staves, ropes or platform required in connection with its transplanting have been removed. The rootballs shall remain intact during all operations.
      b) Girdled Roots: Inspect root crown for girdling roots. Inspection for girdled roots shall be done at the nursery to the extent possible. If girdled roots are not visible at the nursery and are revealed before acceptance, any plant with a girdled root over 1/2-inch shall be rejected.

G. Balled and Burlapped: All plants to be moved balled and burlapped shall be moved with the root systems as solid units with balls of earth firmly wrapped with burlap, firmly held in place by a stout cord and drum lacing, or wire basket. Burlap for containing rootballs shall be untreated, made from biodegradable natural fibers.

H. Container Stock: Container stock shall have a full container with a well-developed root system. Plants loose in the container are not acceptable. The root zone shall be free of circling or kinked roots. Large matted roots at the sides or bottom of the container will not be accepted. Staked plants must be self-supporting when unfastened from the stake. Container grown plants may be substituted for balled and burlapped material if approved by the Landscape Architect.

2.02 PLANT SOURCES

A. The Contractor shall submit to the Landscape Architect any questions regarding the source of any plant.
B. Contract growing of some plants may be required. The Contractor shall identify plant species in need of contract growing within four weeks of beginning work.

2.03 DIGGING SEASON

A. Plants shall be delivered freshly dug from the nursery source. Plants that have been predug the previous season and held at the nursery or another off-site location shall not be accepted.

1. Spring Dig: Plants shall be dug as early as possible and as determined by the nursery owner, and no later than bud break.
   a. Do not transport plants within 14 days after bud break.

2. Fall Dig: Plants shall be dug while dormant, generally following leaf senescence.
   a. Fall Dig Hazard: Some species of trees or shrubs are considered “Fall Transplanting Hazards” by the nursery trade. The Contractor shall identify Fall Transplanting Hazards from the plant schedule, and factor the proper handling of these trees into the overall sequencing of construction and Project schedule. The Contractor shall notify the Landscape Architect of any conflicts arising from this analysis of the plant list and schedule.

2.04 SELECTION AND INSPECTION OF PLANTS

A. The Landscape Architect will review plant and select plant materials at the nursery source prior to digging. At the Landscape Architect’s discretion, plant material may be selected through photographs provided by the Contractor prior. All plants brought to the site will have been reviewed in this manner. Plants that do not have the Landscape Architect’s approval shall be removed from the site.

1. Tagging: At least 3 weeks prior to the expected digging date, request, in writing, the Landscape Architect’s inspection of plant material at the nursery. Provide photographs beforehand if requested by the Landscape Architect.
   a. The Landscape Architect will make his/her own travel arrangements to the nursery.
   b. Seals placed on the selected plants at the nursery shall remain on the plants until Final Acceptance of the work.

2. The Landscape Architect’s basis of plant selection will include:
   a. Conformance with specified genus, species, variety, size, form, rootball and quality.
   b. The visual characteristics of the plants.
c. Plant health.
d. Adherence of the nursery to cultural practices and maintenance procedures that are at or above industry standard.

3. On-Site Inspection:
   a. The Contractor shall permit the Landscape Architect to inspect plants upon their arrival to the project site and at any time prior to planting. The Landscape Architect will inspect the plant materials for size and condition of rootballs and/or root systems, insects, injuries, defoliation, wind burn and latent defects. The Contractor shall remove plant material that is unsatisfactory or defective and replace the plants at no additional cost to the Owner.
   b. The Landscape Architect may reject a specific nursery source and associated plants if he/she determines before, during or after receipt of plants, any of the following:
      1) The nursery stock does not meet health standards set forth herein, including disease and infestation.
      2) The nursery stock does not meet the requirements of the Landscape Architect’s basis of selection as stated herein.
      3) The nursery cannot supply the specified plant(s) or an acceptable substitute cultivar or species.

B. Substitutions: In the event that the Contractor is unable to obtain the plant material specified, either because of unavailability or the failure of the plant material to meet the quality requirements of this Section, the Contractor shall provide substitute plants of equal size, quality, character, overall form, branching habit, color, time of bloom and value to the plant originally specified. The substitute plants shall conform to all requirements of this Section and must be approved by the Landscape Architect.

2.05 PLANTING SOIL MIXTURE AND AMENDMENTS

A. See Section 32 91 13.19, Planting Soil System Procurement, and Section 32 91 19.13, Planting Soil System Installation, for planting soil mixture requirements. The Contractor shall strictly adhere to soil specification composition for each section of the Work.

B. Coordinate installation of soil mixes and plants to meet requirements of this Section and Section 32 91 19.13, Planting Soil System Installation.
2.06 TREE STAKING AND ANCHORING MATERIALS

A. Guying Straps: 3/4-inch-wide “ArborTie” flat polypropylene strap with break strength of 900 pounds minimum.

1. Color: Dark green or black.
   a. As manufactured by:
      1) DeepRoot Green Infrastructure, LLC, 101 Montgomery Street, Suite 2850, San Francisco, CA 94104, info@deeproot.com, Telephone: (415) 781-9700 / Toll Free: (800) 458-7668, Fax: (415) 781-0191.
      2) Platipus Anchors, Inc., 2008 Garner Station Boulevard, Raleigh, NC 27603, Telephone: (866) 752-8478, Fax: (919) 662-0998.
      3) “Or-equal.”

B. Bamboo Stakes: Provide 3/4-inch diameter Bamboo Stakes, 8-foot minimum in length.

C. Large Tree Anchoring System: Rootball anchoring system shall be as manufactured by Platipus Anchors, Inc., 2008 Garner Station Boulevard, Raleigh, NC 27603, Telephone: (866) 752-8478, “or-equal.” System shall be Platipus rootball fixing system, including Plati-Mat, Model No. RF2RP.

1. Work with manufacturer to confirm the correct size of anchoring system for specified trees.

D. Deadman Anchors: 9-inch by 5-3/4-inch by 4-foot length precast concrete, or approved equal. Provide three per tree as indicated on Drawings.

2.07 MISCELLANEOUS MATERIALS

A. Natural Burlap: Provide medium weight (7-ounce per square yard) natural burlap.

B. Anti-Erosion Mulch or Weed-free Straw Bales: Materials shall conform to Section 01 57 13, Temporary Erosion and Sediment Control.

C. Refer to Section 31 10 00, Site Clearing.

D. Siltation Fence: Materials shall conform to Section 01 57 13, Temporary Erosion and Sediment Control.
E. Anti-Desiccant:

1. Provide emulsion type, film forming agent designed to permit vapor transmission but retard excessive moisture loss. Use anti-desiccant only with the approval of the Landscape Architect. Acceptable Manufacturers:
   b. Cloud Cover as manufactured by Easy Gardener, P.O. Box 21025, Waco, TX 76702-1025, Telephone: (254) 753-5353, www.easygardener.com.

F. Soil and Pavement Protection:

1. The driving of vehicles over planted areas is expressly prohibited. Protect subgrade, planting soils and pavements using one of the following:
   a. Plywood: Provide 3/4-inch Grade C or better plywood for use as planking when driving vehicles or moving equipment over areas to be planted.
   b. Oriented Strand Board (OSB): Two layers of 3/4-inch OSB on top of 6-inch mulch. Provide Filter Fabric under mulch layer.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. Pre-Installation Examination Required: The Contractor shall examine previous work, related work, and conditions under which this work is to be performed and notify the Landscape Architect in writing of all deficiencies and conditions detrimental to the proper completion of this work. Beginning work means Contractor accepts substrates, previous work, and conditions. The Contractor shall not place any plants or planting soil mixtures until all work in adjacent areas is complete and accepted by the Landscape Architect.

B. Concealed Conditions: Notify Landscape Architect before planting when below grade or on-structure conditions detrimental to proper plant growth are encountered. Do not proceed with planting without specific written instructions from the Landscape Architect. At the Landscape Architect’s direction and at no additional expense to the Owner, plants shall be relocated to avoid the obstruction.
C. Deliver materials and plants only after preparations for planting have been completed and accepted, including but not limited to: planting soil system, irrigation (minimum: Mainline), rough grading, utilities, decompaction or remediation of soils. The Landscape Architect will determine when the site is acceptable for planting.

3.02 HANDLING OF PLANTS

A. Protect bark, branches, and root systems from sun scald, drying, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape.

B. Provide a double tarp protective covering over exterior plants during transport.

C. Do not drop exterior plants during delivery.

D. Do not loosen drum-lacing nor remove container-grown stock from containers before time of planting.

E. Do not move trees if rootballs are saturated.

F. Handle planting stock by supporting the rootball or container.

3.03 TEMPORARY STORAGE OF PLANTS

A. Storage – General:

1. For plants stored on or off-site for more than 24 hours, the Contractor shall keep a log that records dates of watering.

2. The contractor shall fully inspect and maintain plants for the entire duration of the storage period.

3. All stored plants shall remain the property of the Contractor and shall be replaced in kind to meet the standards defined herein for healthy plants and the character and habit defined herein. The Landscape Architect shall be the sole evaluator of whether replacement plants match the originally stored plants.

4. No plant shall be stored more than 4 weeks without prior written acceptance by the Landscape Architect.
B. Storage of Plants Less than 1 week:

1. If planting is delayed more than 6 hours after delivery of plants to the site, the Contractor shall adhere to the following practices:
   a. Set plants in shade, protect from weather and mechanical damage, and keep roots moist.
   b. Store plants upright with room between rootballs.
   c. Closely monitor plants for sufficient root moisture.
   d. Store all plant materials in a secure and clean location, free from conditions that would be harmful and/or deleterious to the immediate or long-term health of the trees.

C. Storage of Plants More than 1 week:

1. The Contractor shall store plants at a location mutually agreed upon by the Contractor and Landscape Architect.
2. Space plants sufficiently apart to prevent damage or death to branches and leaves. During all seasons, set balled stock upright and plumb on firm ground and cover the ball with fully aged and decomposed wood mulch or other material acceptable to the Landscape Architect.
3. During the growing season, stored plant material shall be watered and the rootballs kept moist with an automatic drip irrigation system to prevent drying out. Mist plants several times a day as necessary to reduce transpiration in sunny or windy locations.
4. During the dormant season, rootballs shall be insulated against freezing and cold weather damage. Plants shall be protected from wind and ice damage.
   a. During winter months, stored plant material shall also be monitored for soil moisture and watered as needed to prevent desiccation. Plants shall generally be watered about once each month to keep the soil moist, but not wet.
5. During the storage period, inspect all plants for pests and diseases and, if found, have them evaluated by an arborist certified in the state where the project is located.
   a. Before proceeding, report on the presence of any diseases or pests.
   b. Before proceeding, report on issues and recommended treatment to the Landscape Architect for review and approval.
   c. Whenever possible, select and use organic treatments.
   d. Isolate trees with diseases or pests and remove and replace if the Landscape Architect determines that the plants are unusable.
3.04 PLANT LAYOUT

A. Horizontal Layout: The plant locations shown on Drawings are approximate. The Contractor shall layout the final location of individual plants by stake or flag and obtain the Landscape Architect’s approval of locations before starting installation. After staking is accepted, set plants in place for final review and acceptance by the Landscape Architect. The Contractor shall make revisions and adjustments as directed by the Landscape Architect.

1. Contractor shall not stake plant locations until proper subgrade, drainage, and subsoil layers are installed.
2. Contractor shall verify the locations of all unground utilities before staking plant locations.
3. Indicate the species and size of plant on the stake or flag.
4. Contractor shall make adjustments as determined by the Landscape Architect without additional cost to the Owner.

B. Vertical Layout: Set the elevation of trees through the use of string lines or by instrumentation. Demonstrate to the Landscape Architect through the use of stakes and string that trees have been set at the correct elevation prior to completing planting and installing the upper soil horizon, if requested.

3.05 PLANTING WOODY PLANTS

A. General:

1. Sequence of Planting: Plant trees and shrubs after the subgrade has been accepted and concurrently with the Horticultural Subsoil planting soil layer unless otherwise approved by the Landscape Architect. Complete landscaping work as quickly as possible on portions of the site as they become available for landscaping.
2. If plants are installed in planting pits, scarify sides of pits before placing trees.
3. Grade Stakes: If present, protect and maintain grade stakes and location stakes until removal is acceptable to the Landscape Architect and all parties involved in this Project. If grade stakes are not present, establish grade stakes to ensure that grades shown on Drawings are being met.
4. Painting: Do not paint vegetation for any reason.

B. Rootball and Rootflare:

1. Rootball Pedestals: Provide a rootball pedestal composed of subgrade fill immediately beneath the ball or root mass. Pedestal shall provide the relationship to finish grade described below and prevent settlement of the plant. Compact pedestal to 95 percent Standard Proctor.
2. Identifying and Exposing the Root Flare: Prior to setting the height of the rootball pedestal, the Contractor shall remove burlap and twine from the top of the rootball and inspect each plant to determine if the trunk flare is buried within the rootball. If buried, the Contractor shall expose the trunk flare by removing excess fill on top of rootball, taking care not to damage the bark or roots while removing the soil overburden. Adventitious roots and girdling roots shall be removed with sharp pruners. Adjust the rootball pedestal to position the trunk flare 2-inch to 3-inch higher than the proposed finished grade.

3. Wire Baskets: Once set, completely remove top one-third of wire basket. Cleanly cut each tier of all horizontal wires making one cut centered between each set of vertical wires.
   a. Burlap: Completely remove top one-third of burlap.

4. Drum lacing and Burlap: Once set, remove top one-third of lacing and burlap.

5. Containerized Plants: Completely remove container. Cut out container with a sharp blade if container does not readily separate from the rootball.

6. Scarification of Balled and Burlapped Plants: The Landscape Architect will examine the exposed rootball and determine if the Contractor shall scarify the sides of the rootball. Scarification shall result in no additional expense to the Owner.

7. Scarification of Containerized Plants: The Contractor shall scarify the rootballs of container plants with a sharp blade 2-inch in length. Rest the plant on its side and scarify an ‘X’ on the bottom of the root mass. Then make vertical cuts that are the full height of the rootball every 3 inches OC of the full circumference.

8. Rootballs shall be kept in a moist, but not wet, condition. Protect rootballs from damage due to sun and wind. Contractor shall strictly limit the time between exposing the rootball and backfilling. Protect exposed rootballs with burlap or other shading device until backfilled.

C. Placement of Planting Soil Mixture at Woody Plants: Place planting soil mix to levels shown on Drawings and described in Section 32 91 19.13, Planting Soil System Installation.

1. Maintain at all times during the planting operations at least one stockpile of each approved type of plant soil mixture.

2. Planting soil shall be in full contact with the rootball, with no voids or air pockets. Where burlap is present, burlap shall be tightly pressed between backfill and rootball. Folded or bunched burlap will create an obstruction to backfill and rootball contact and shall be removed.
3. Backfilling of Tree Pits in Existing Soil Areas (SC): Backfill with planting soil mix in 6-inch layers. Hand tamp each layer to eliminate voids and air pockets before placing subsequent layers. Continue until backfill has reached finish grade shown on Drawings.

4. Watering Dish and Mulch: Construct a watering dish as shown to promote water infiltration into the root zone. Hand tamp edges of watering dish to be firm and withstand hose pressure. Cover watering dish with mulch, leaving a 4-inch gap between mulch and the trunk.

D. Watering:

1. Flood all plants with water twice within the first 24 hours after planting. Take care to avoid saturating adjacent soils where planting operations are ongoing. Monitor water pressure. Displacement of soil materials including watering dish by watering shall not be acceptable.

2. Flood all plants during the construction and maintenance periods at least twice each week. If present and operational, coordinate programming of irrigation system to meet watering needs. If irrigation system is not operational, provide hand watering as needed to maintain healthy growth. At each watering, thoroughly saturate the soil around each tree and shrub. If sufficient moisture is retained in the soil as determined by the Landscape Architect, the required watering may be reduced. Trees will require a minimum of 20 gallons of water for each watering. Shrubs will require a minimum of 10 gallons of water for each watering.

   a. Winter Watering: Lack of adequate soil moisture is often a major cause of winter damage. All plants, but especially narrow leaf and broadleaf evergreens, use water during winter. Moisture must be available below the frost line or frozen soil.

      1) Plants should be watered thoroughly in the fall to prepare them for the winter months.

      2) During dry winters, broadleaf evergreens should be watered about once each month.

E. Plant Anchoring System: Install anchoring deadman and guy wires during subgrade construction. Adjust and reset guys during maintenance period as necessary.

1. Bamboo Staking: Wrap bamboo stake with a minimum of five layers of burlap where stake is in contact with tree trunk.
3.06 PLANTING POTTED HERBACEOUS PLANTS

A. The Contractor shall scarify the rootballs of container plants. Using a sharp knife, make vertical cuts the full height of the rootball at a depth of 2-inch and every 3 inches OC.

3.07 PLANTING HERBACEOUS PLUGS

A. Install the plug so the stem base is at or slightly above finish grade. Plant plugs fully into planting soil, not mulch.

B. Install plugs to their full depth. A “J-Root” installation shall not be acceptable.

C. Tamp each plug in place so that it is firmly seated in the soil, with no air pockets.

3.08 SOIL DIAGNOSTICS DURING THE MAINTENANCE PERIOD

A. If plants exhibit unsatisfactory growth during the maintenance period, perform soil testing for chemical properties, compaction and infiltration rates. See Section 32 91 19.13, Planting Soil System Installation, for testing definitions, sampling methods and procedures. Adhere to Landscape Architect’s recommend remediation. Remediation may include, but are not limited to, soil amendments, soil decompaction or fertilization.

3.09 TEMPORARY EROSION CONTROL

A. The construction of the site will initiate with the installation of measures sufficient to control sediment deposits and erosion. All sediment control measures will be maintained until all upstream ground within the construction area has been completely stabilized with permanent vegetation and all walks have been paved.

B. The Contractor shall remove accumulated sediments when they reach half the capacity of the erosion control devices. Sediment/erosion control devices must be checked after each storm event.

C. The Contractor is responsible for cleaning any and all sediment leaving the site. The Contractor shall be responsible for repairing all damages caused by the accumulation of sediment.

D. Failure to install, operate, or maintain all erosion control measures will result in the cessation of all construction until such measures are corrected to the local jurisdiction or city standards.
3.10 FINE GRADING

A. Prior to fine grading, Contractor shall verify that the rough grading, under drainage system, planting soil mixes, planting of woody plants and irrigation system have been accepted.

B. Fine Grading: Set finished grades by instrumentation. At minimum, set stakes at the bottom, middle, and top of slopes and at the edges and centers of plant beds. Connect contours and spot elevations with an even slope.

1. Fine grade planted areas shall have an even surface free from ridges, rills or depressions. Surface of planting soil shall be free draining have a fine texture.
2. All large stiff clods, lumps, brush, roots, litter and other foreign matter, and stones over one inch in diameter, shall be removed from the planting soil surface. Planting soil shall be free of smaller stones in excessive quantities as determined by the Landscape Architect.

3.11 PROTECTION, REPAIR AND CLEANUP

A. Protect new and existing site improvements from damage due to planting operations.

1. Underdrainage and Irrigation: Underdrainage and elements of the Irrigation System will be in place when planting activities begin. The contractor shall coordinate with the work of those Sections, and shall take all precautions to prevent damage to them. If damage occurs, the Contractor shall stop work and immediately report the damages to the Owner’s Representative and Landscape Architect. Work shall not resume until all work is repaired, inspected and accepted by the Landscape Architect.
2. The Contractor shall pay for all remediation to damages.

B. Limit all conditions that retard the growth of the plants, whether installed or when in storage.

C. The Contractor shall be strictly prohibited from tracking or driving over newly planted areas.

1. In areas where tracking or driving cannot be avoided, the Contractor shall install a protective barrier between the vehicle and the soil surface as approved by the Landscape Architect.
D. Restore areas disturbed by planting activities, or if otherwise eroded, settled, or disturbed after fine grading, and prior to groundcover or meadow installation.

E. Tags: Remove all identification labels, seals and tags at Final Acceptance of the Project.

      Effects.
   b. NSF/ANSI 372, Drinking Water System Components - Lead
      Content.

3. Standard Specifications and Standard Details, City of Tulsa Engineering
   Services Department, latest edition (City of Tulsa Standard
   Specification).

1.02 SUBMITTALS

A. Action Submittals:

1. Water conveyance materials, such as pipes, joints, valves, meters,
   hydrants and other such materials, shall be in accordance with the City
of Tulsa Standard Specifications and listed as an approved manufacturer.
2. Detailed pipe, valve, meter, and hydrant drawings showing details, special fittings and bends, dimensions, coatings, and other pertinent information.
3. Pressure class.
4. Wall thickness, reinforcing, and strength calculations.
5. Valves: Certification for compliance to NSF/ANSI 61 for valves used for drink water service.
6. Product Data: Manufacturer’s data for couplings, saddles, gaskets, and other pipe accessories. Indicate maximum rated working pressure and test pressure for each item.

B. Informational Submittals: Manufacturer’s Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements.

1.03 DELIVERY, STORAGE, AND HANDLING

A. In accordance with manufacturer’s recommendations.

B. Marking at Plant: Mark each pipe and fitting at plant. Include date of manufacture, manufacturer’s identification, specification standard, diameter of pipe, pipe class, and other information required for type of pipe.

C. Pipe, valves, fittings, and other equipment received at Project Site in damaged condition will not be accepted.

D. Gasket Storage: Store rubber gaskets in cool, well ventilated place, and do not expose to direct rays of sun. Do not allow contact with oils, fuels, petroleum, or solvents.

E. Store and support pipe securely to prevent accidental rolling and to avoid contact with mud, water, or other deleterious materials.

F. Handling:
   1. Pipe shall be handled with proper equipment in a manner to prevent distortion or damage. Use of hooks, chains, wire ropes, or clamps that could damage pipe, damage coating or lining, or kink and bend pipe ends is not permitted.
   2. Use heavy canvas, or nylon slings of suitable strength for lifting and supporting materials.
   3. Lifting pipe during unloading or lifting into trench shall be done using two slings placed at quarter point of pipe section. Pipe may be lifted using one sling near center of pipe, provided pipe is guided to prevent
uncontrolled swinging and no damage will result to pipe or harm to workers. Slings shall bear uniformly against pipe.

4. Pipe and fittings shall not be stored on rocks or gravel, or other hard material that might damage pipe. This includes storage area and along pipe trench.

PART 2   PRODUCTS

2.01 DUCTILE IRON PIPE

A. Where ductile iron pipe (DIP) 3 inches in diameter and larger is specified, it shall conform to, and be tested in accordance with, the current American National Standard for Ductile Iron Pipe, Centrifugally Cast in Metal Molds or Sand-Lined Molds, for Water or Other Liquids, ANSI/AWWA C151/A21.51.

B. Fittings for ductile iron pipe shall be cast or ductile iron. Cast iron and ductile iron fittings shall conform to the American National Standard for Ductile-Iron and Gray-Iron Fittings, 3-inch through 48-inch, ANSI/AWWA C110; or the American National Standard for Ductile-Iron Compact Fittings, 3-inch through 48-inch, ANSI/AWWA C153.

C. Mechanical joints and push-on joints shall conform to, and be tested in accordance with, the American National Standard for Rubber Gasket Joints for Ductile-Iron and Gray-Iron Pressure Pipe and Fittings, ANSI/AWWA C111/A21.11.

D. Cast iron and ductile iron pipe and fittings shall be bituminous coated outside and cement-mortar lined inside with seal coat in accordance with American National Standard for Cement Mortar Lining for Ductile-Iron and Gray-Iron Pipe and Fittings for Water, ANSI/AWWA C104/A21.4.

E. All ductile iron and cast-iron pipe and fittings shall be encased with polyethylene tube in accordance with AWWA C105, American National Standard for Polyethylene Encasement for Ductile Iron Piping for water and other liquids. Polyethylene film shall be manufactured of virgin polyethylene material conforming to ASTM D1248, Type 1, Class A or Class C, Grade E. Thickness shall be not less than 8 mils (0.008 inch). Tensile strength shall be 1,200 psi, minimum. Elongation shall be 300 percent, minimum. Tube length shall provide at least 1 foot of overlap at each joint of pipe. Tape shall be a 2-inch width, plastic backed adhesive tape, Polykan #900, Scotch #50, “or-equal.”
2.02 POLYVINYL CHLORIDE (PVC) PIPE

A. Polyvinyl chloride (PVC) pipe shall conform to ASTM D1784 and ASTM D1785 and shall be Schedule 40 or Schedule 80, Type I, Grade I, Class 12454-B.

B. Provide fittings that have the same schedule as the PVC pipe.

C. Pipe fitting and joints shall be solvent welded except where threaded or transitional material joints are required.

D. Solvent welded joint cement shall comply with ASTM D2564 and ASTM F656.

E. Wipe away loose dirt and moisture from the ID and OD of the pipe end and the ID of the fitting before applying solvent cement. Do not apply solvent cement to wet surfaces. Allow at least 8 hours of drying time before moving solvent welded joints or subjecting the joints to any internal or external loads or pressures.

2.03 COPPER TYPE K

A. Copper Type K Tubbing shall be used from the water main to the meter in accordance with City of Tulsa Standard Specifications and Details.

B. Copper Type K Tubbing shall conform to ASTM B75, ASTM B88, and ASTM B68.

2.04 SERVICE SADDLES

A. Split case iron tapping sleeves shall be of 150 psi working pressure. Sleeve body shall be cast iron conforming to ANSI/AWWA C110. Sleeve shall have mechanical joints conforming to AWWA C111 on the run and a flange branch conforming to ANSI B16.1, Class 125. End gaskets shall be natural rubber or neoprene material conforming to ANSI/AWWA C111.

B. Flexible stainless steel tapping sleeves shall be rated at 150 psi pressure, with flanges meeting AWWA C207. Assembly shall be NSF or UL rated. Bolts, nuts, and washers shall be stainless steel. Gaskets shall conform to ANSI/AWWA C111.

2.05 FIRE HYDRANTS

A. Fire hydrants shall conform to the AWWA Standard for Dry-Barrel Fire Hydrants, ANSI/AWWA C502.
B. Fire hydrants shall have breakable connection features and a breakable coupling on the stem immediately above the bury line which has a lower breaking point than the rest of the unit; 5-1/4-inch compression main valve; 6-inch inlet connection; standard bell or mechanical joint hub; three-foot six-inch bury length, or as specified on Drawings; two 2-1/2-inch hose nozzles with National Standard threads; one 4-inch pumper nozzle with Tulsa Standard threads (refer to City of Tulsa Standard Detail for Fire Hydrants); "O" ring seal; drain valve; left (counter-clockwise) opening; Federal yellow finish paint above ground line; and National Standard pentagon operating nut.

C. Only those fire hydrants which have been approved by the City of Tulsa will be permitted.

2.06 VALVES

A. Where 2-inch through 12-inch gate valves are specified, they shall be resilient-wedged and conform to and be tested in accordance with ANSI/AWWA C509. The valve shall be bubble tight from either direction at the rated design pressure of 200 psi. The valve shall have a single disc gate with synthetic rubber seat bonded or mechanically attached to the disc; non-rising stem with 2-inch AWWA operating nut; counter clockwise opening, “O” ring stem seals, and corrosion resistant interior coating acceptable for potable water use.

B. Mark AWWA gate valves with manufacturer’s name or mark, year of valve casting, valve size, and working water pressure.

C. Repaired AWWA gate valves will not be allowed.

D. Only those valves which have been approved by the City of Tulsa will be permitted.

2.07 VALVE BOXES

A. Gray iron castings for valve boxes shall conform to and be tested in accordance with the Standard Specification for Gray Iron Castings ASTM A48 and applicable sections of Drainage Structure Castings, AASHTO M306, current edition. All castings, including manhole steps, lamphole covers, water meter lids, manhole frames and lids, adjustment rings and valve boxes shall be Class 35B iron.

B. Only those castings which have been approved by the City of Tulsa will be permitted. Approval for each casting shall consist of approved shop drawings, plus laboratory test reports of the tensile test and lad test.
2.08 WATER METER
   A. Water meters shall be in accordance with Division 5, Water Meter Specifications, of the City of Tulsa Standard Specifications.
   B. Displacement water meters shall conform to current standard specifications of the AWWA C700, latest edition, “Cold Water Meters – Displacement Type.”
   C. The meter size and pressure shall conform to Table 1, “Characteristics of Displacement Type Meters,” of AWWA C700.

2.09 WATER SERVICE CONNECTION
   A. Water service connections from the water main to the meter shall be in accord with the City of Tulsa Standard Specifications and details. This includes corporation stops, service clamps, piping, ball valves, angle valves, double check valves, joints, metering cans, lids, and other required features.

2.10 CONCRETE FOR THRUST BLOCKS
   A. Thrust Block Concrete: As specified in Section 03 30 00, Cast-in-Place Concrete.
   B. Reinforcing Steel: ASTM A615/A615M, Grade 60 deformed bars.
   C. Welded Wire Fabric: ASTM A497/A497M.
   D. Formwork: Plywood or earth cuts may be used as approved by Engineer.

2.11 PIPE LOCATING TAPE
   A. As specified in Section 31 23 23.15, Trench Backfill.

2.12 PIPE BEDDING AND PIPE ZONE MATERIAL
   A. As specified in Section 31 23 23.15, Trench Backfill.

2.13 TRENCH STABILIZATION MATERIAL
   A. As specified in Section 31 23 23.15, Trench Backfill.

PART 3 EXECUTION

3.01 GENERAL
   A. Notify Engineer at least 2 weeks prior to field fabrication of water system.
B. Furnish feeler gauges of proper size, type, and shape for use during installation for each type of pipe furnished.

C. Distributing Materials: Place materials along trench only as will be used each day, unless otherwise approved by Engineer. Placement of materials shall not be hazardous to traffic or to general public, obstruct access to adjacent property, or obstruct others working in area.

3.02 EXAMINATION

A. Verify size, material, joint types, elevation, and horizontal location of existing pipeline to be connected to new pipeline or new equipment.

B. Inspect size and location of structure penetrations to verify adequacy of wall pipes, sleeves, and other openings.

C. Damaged Coatings and Linings: Repair using coating and lining materials in accordance with manufacturer’s instructions.

3.03 PREPARATION OF TRENCH

A. Prepare trench as specified in Section 31 23 16, Excavation.

3.04 INSTALLATION

A. General:

1. Join pipe and fittings in accordance with manufacturer’s instructions, unless otherwise shown or specified.

2. Install individual pipe lengths in accordance with approved lay diagram. Misplaced pipe shall be removed and replaced.

3. Inspect pipe and fittings before installation, clean ends thoroughly, remove foreign matter and dirt from inside.

4. Couplings:
   a. Install in accordance with manufacturer’s written instructions.
   b. Before coupling, clean pipe holdback area of oil, scale, rust, and dirt.
   c. Clean gaskets before installation.
   d. If necessary, lubricate with gasket lubricant for installation on pipe ends.
   e. Tighten coupling bolts progressively, drawing up bolts on opposite sides gradually until bolts have uniform tightness.
B. Buried Pressure Pipe:

1. Concrete Encased or Embedded Pipe: Do not encase joints in concrete, unless specifically shown on Drawings.

2. Placement:
   a. Keep trench dry until pipe laying and joining is completed.
   b. Exercise care when lowering pipe into trench to prevent twisting or damage to pipe.
   c. Measure for grade at pipe invert, not at top of pipe.
   d. Excavate trench bottom and sides of ample dimensions to permit proper joining, welding, visual inspection, and testing of entire joint.
   e. Prevent foreign material from entering pipe during placement.
   f. Close and block open end of last laid pipe section when placement operations are not in progress and at close of day’s work.
   g. In general, lay pipe upgrade with bell ends pointing in direction of laying.
   h. Deflect pipe at joints for pipelines laid on a curve using unsymmetrical closure of spigot into bell. If joint deflection of standard pipe lengths will not accommodate horizontal or vertical curves in alignment, provide:
      1) Shorter pipe lengths.
      2) Special mitered joints.
      3) Standard or special fabricated bends.
   i. Check gasket position with feeler gauge to assure proper seating.
   j. After joint has been made, check pipe alignment and grade.
   k. Place sufficient pipe zone material to secure pipe from movement before next joint is installed.
   l. Prevent uplift and floating of pipe prior to backfilling.

3. Tolerances:
   a. Joint Deflection: Maximum of 75 percent of manufacturer’s recommendation.

4. Cover Over Top of Pipe: Minimum 2 feet, unless otherwise shown.

3.05 THRUST RESTRAINT

A. Thrust Blocking:

   1. Place only where shown on Drawings.
   2. Quantity of Concrete: Sufficient to cover bearing area of pipe and provide required soil bearing area as shown on Drawings.
   3. Place blocking so pipe and fitting joints are accessible for repairs.
3.06 PLACEMENT OF PIPE LOCATING TAPE

A. Place pipe locating tape in accordance with Section 31 23 23.15, Trench Backfill.

3.07 PIPE BEDDING AND ZONE MATERIAL

A. Place pipe bedding and pipe zone material in accordance with Section 31 23 23.15, Trench Backfill.

3.08 FIELD QUALITY CONTROL

A. Pressure Leakage Testing: As specified in the individual specification(s) following this section.

3.09 CLEANING

A. Following assembly and testing, and prior to disinfection and final acceptance, flush pipelines with water at 2.5 fps minimum flushing velocity until foreign matter is removed. Dispose of water and flushed foreign matter.

B. Remove accumulated debris through blowoffs 2 inches and larger or by removing spools and valves from piping.

C. Disinfection: As specified in Section 33 13 00, Disinfection of Water Utility Distribution Facilities.

SECTION 33 05 16.13
PRECAST CONCRETE UTILITY STRUCTURE

PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards that may be referenced in this section:

2. ASTM International (ASTM):
   b. A615/A615M, Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
3. Occupational Safety and Health Administration (OSHA):

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Detailed drawings showing complete information for fabrication including, but not limited to:
      1) Member dimensions and cross sections; location, size, and type of reinforcement, including additional reinforcement.
      2) Layout dimensions and identification of each precast unit.
      3) Welded connections indicated by AWS standard symbols.
      4) Details of connections, joints, accessories, and openings or inserts.
5) Watertight joint details.
6) Location and details of anchorage devices.
7) Access door details.
8) Details of ladder and pull-up extension.
9) If applying slope after precasting, submit proposed procedure prior to application.

b. Product Data:
   1) Precast concrete items; show materials of construction by ASTM reference and grade.
   2) Joint sealants.

B. Informational Submittals:
   1. Manufacturer’s data for lifting devices for handling and erection.
   2. Manufacturer’s certification that vault design and manufacture comply with referenced ASTMs (for example, ASTM C857 and ASTM C858).
   3. Vault design calculation shall be signed by a civil or structural engineer registered in the State of Oklahoma.
   4. Manufacturer’s laboratory test reports.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Store each unit in a manner that will prevent cracking, distortion, warping, straining and other physical damage, and in a manner to keep marking visible.

B. Lift and support each unit only at designated lifting points and supporting points as shown on Shop Drawings.

PART 2 PRODUCTS

2.01 VAULT MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:
   1. Oldcastle Precast.
   2. Jensen Precast.
   3. Hanson Pipe and Precast.

2.02 PRECAST CONCRETE VAULTS

A. Design Requirements:
   1. In the event of a conflict between or among standards, the more stringent standard shall govern.
   2. Comply with ASTM C858, except as modified herein.
3. Reinforcing Steel:
   a. Deformed Bars: ASTM A615/A615M, Grade 60.
   b. Welded Wire Fabric: ASTM A497/A497M.
4. Nominal Dimensions: As shown on Drawings.
5. Construction: Rigid type and behave monolithically. Do not use panel-type vaults.
6. Design Loads: As determined by ASTM C857, and by using Site-specific values as specified in the General Structural Notes on Drawings with the following exceptions:
   b. Designed to avoid flotation with a factor of safety equal to 1.2.
7. Design shall accommodate additional stresses or loads that may be imposed during factory precasting, transporting, erection, and placement.
8. Blockouts for penetrations shall be as shown on Drawings.
9. Sealant:
   a. Nonswelling preformed joint sealants to provide a lasting, watertight bond.
   b. Manufacturer and Product: Henry Company; RAM-NEK.
10. Mortar: Comply with ASTM C387/C387M, Type S or use Type I grout as specified in Section 03 62 00, Nonshrink Grouting.

B. Mark each member or element to indicate location in the structure, top surface, and date of fabrication.

C. Vault Floor:
   1. Slope vault floor to sump.
   2. Slope may be applied after precasting, using mortar fill as specified in Section 03 30 00, Cast-in-Place Concrete, or Type I grout as specified in Section 03 62 00, Nonshrink Grouting.

2.03 ACCESSORIES
A. Ladder:
   1. Provide vault with galvanized steel ladder. Conform to requirements of Section 05 50 00, Metal Fabrications. Provide with pull-up extension.
B. Sidewalk Doors and Hatches: Conform to requirements of Section 05 50 00, Metal Fabrications. Shall be HS-20 load rated and lockable with size as indicated on Drawings. Doors and hatches shall be provided with antislip coating and concrete embeds.
C. Pipe Connections to Vault: Modular mechanical seal conforming to requirements of Section 33 05 01, Conveyance Piping—General.

2.04 PULL BOXES FOR EAST BANK HYDRAULIC LINES

A. Pull boxes for the east bank hydraulic lines shall be polymer concrete with a minimum size of 24-inch by 36-inch.

B. Polymer concrete boxes and the cover shall meet ASTM C857 for Underground Precast Concrete Utility Structures. The minimum load rating shall be 10,000 pounds per ANSI Tier 8.

C. Pull boxes shall have open bottoms. Hardware locking screws shall be stainless steel.

D. The cover shall be polymer concrete with a nonskid surface. The cover shall be labeled with “Flume Hydraulics.”

PART 3 EXECUTION

3.01 GENERAL

A. Possible Settlement: If subgrade is encountered that may require removal to prevent structure settlement, notify Engineer. Engineer will determine depth of over excavation and means of stabilizing subgrade prior to structure installation.

B. Place structural fill in accordance with Section 31 23 23, Fill and Backfill, below vault on undisturbed earth or modified subgrade; thoroughly compact with a mechanical vibrator or power tamper. Meet requirements of Article Excavation and Backfill.

3.02 EXCAVATION AND BACKFILL

A. Remove and keep water clear from excavation during construction.

B. Excavation: As specified in Section 31 23 16, Excavation.

C. Backfill: As specified in Section 31 23 23, Fill and Backfill, and Section 31 23 23.15, Trench Backfill.

3.03 INSTALLATION

A. Concrete Base:

1. Place on prepared subgrade.
2. Properly locate, ensure firm bearing throughout, and plumb first section.

B. Sections:
   1. Carefully inspect precast sections to be joined.
   2. Thoroughly clean ends of sections to be joined.
   3. Do not use sections with chips or cracks.

C. Joints:
   1. Fill joints between precast sections per manufacturer’s recommendation.
   2. Joints shall be watertight to prevent entrance of groundwater.
   3. Joint Finish: Dry pack interior of joints to provide smooth finish.

D. Setting Precast Vault: Install vault to elevations shown on Drawings.

E. Watertight construction below grade with no open cracks or spalls. Cracking and defective areas of concrete shall be repaired per requirements of Section 03 30 00, Cast-in-Place Concrete, and Section 03 64 23, Crack Repair Epoxy Injection Grouting.

3.04 PIPE CONNECTION TO VAULT

A. Install products in accordance with manufacturer’s instructions.

END OF SECTION
PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Water Works Association (AWWA):
   a. B300, Hypochlorites.
   b. B301, Liquid Chlorine.
   c. B302, Ammonium Sulfate.
   d. B303, Sodium Chlorite.
   e. C600, Installation of Ductile Iron Water Mains
   f. C651, Standard for Disinfecting Water Mains.
   g. C652, Disinfection of Water Storage Facilities.
   h. C653, Disinfection of Water Treatment Plants.

3. NSF International (NSF):
   a. NSF/ANSI 61, Drinking Water System Components - Health Effects.
   b. NSF/ANSI 372, Drinking Water System Components - Lead Content.

1.02 SEQUENCING

A. Commence disinfection after completion of following:

1. Hydrostatic pressure testing, functional and performance testing and acceptance of pipelines and equipment.

PART 2 PRODUCTS

2.01 GENERAL

B. Contractor shall assist the City with the testing as required.
C. Water mains shall be tested in accordance with the Standard Specifications for Installation of Ductile Iron Water Mains and their Appurtenances, AWWA C600.

D. A pressure test of 150 psi shall be performed for 30 minutes and pass the test without significant pressure drop. A leakage test shall be made at normal operating pressures for the proposed line for a 2-hour period and pass the test without significant pressure drop.

E. Before being placed into service, water mains shall be chlorinated in accordance with Standard for Disinfecting Water Mains, AWWA C651.

F. Where temporary plugs are required for pressure testing, the Contractor shall furnish and install the plug and temporary blocking. The cost for temporary plugs and similar features shall be included in the unit price for the water pipe.

2.02 WATER FOR DISINFECTION AND TESTING

A. Clean, uncontaminated, and potable.

B. Owner will supply potable quality water. Contractor shall convey in disinfected pipelines or containers.

PART 3 EXECUTION

3.01 GENERAL

A. Conform to AWWA C651 and AWWA C600 for pipes and pipelines, except as modified in these Specifications.

B. Contractor’s Equipment:

1. Furnish chemicals and equipment, such as pumps and hoses, to accomplish disinfection.

2. Water used to fill pipeline may be supplied using a temporary connection to existing distribution system. Provide protection against cross-connections as required by AWWA C651.

C. Disinfect the following items installed or modified under this Project, intended to hold, transport, or otherwise contact potable water:

1. Pipelines: Disinfect new pipelines that connect to existing pipelines up to point of connection.
2. Disinfect surfaces of materials that will contact finished water, both during and following construction, using one of the methods described in AWWA C652 and AWWA C653. Disinfect prior to contact with finished water. Take care to avoid recontamination following disinfection.

D. Prior to application of disinfectants, clean pipelines of loose and suspended material.

E. Allow freshwater and disinfectant solution to flow into pipe or vessel at a measured rate so chlorine-water solution is at specified strength. Do not place concentrated liquid commercial disinfectant in pipeline or other facilities to be disinfected before it is filled with water.

3.02 TURBIDITY

A. Cleaning of equipment and facilities shall include removal of materials that result in a turbidity exceeding limits stated in Article Testing.

3.03 PIPING AND PIPELINES

A. Cleaning:

1. Before disinfecting, clean foreign matter from pipe in accordance with AWWA C651.

2. If continuous feed method or slug method of disinfection, as described in AWWA C651, are used flush pipelines with potable water until clear of suspended solids and color. Provide hoses, temporary pipes, ditches, and other conduits as needed to dispose of flushing water without damage to adjacent properties.

3. Flush service connections and hydrants. Flush distribution lines prior to flushing hydrants and service connections. Operate valves during flushing process at least twice during each flush.

B. Disinfecting Procedure: In accordance with AWWA C651, unless herein modified.

3.04 DISPOSAL OF CHLORINATED WATER

A. Do not allow flow into a waterway without neutralizing disinfectant residual.

B. See appendix of AWWA C651 for acceptable neutralization methods.
3.05 TESTING

A. Collection of Samples:
   1. Coordinate activities to allow Samples to be taken.
   2. Provide valves at sampling points.
   3. Provide access to sampling points.

B. Chlorine Concentration Sampling and Analysis: Testing and chlorination by the City of Tulsa.

C. If minimum Samples required above are bacterially positive, disinfecting procedures and bacteriological testing shall be repeated until bacterial limits are met.

PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section and any supplemental Data Sheets:

1. American Association of State Highway and Transportation Officials (AASHTO):

2. American Water Works Association (AWWA):
   c. C110/A21.10, Ductile-Iron and Gray-Iron Fittings, 3 in. Through 48 in. (75 mm Through 1200 mm) for Water and Other Liquids.
   e. C151/A21.51, Ductile-Iron Pipe, Centrifugally Cast, for Water.

3. ASTM International (ASTM):
   b. C14, Standard Specification for Concrete Sewer, Storm Drain, and Culvert Pipe.
i. C497, Standard Test Methods for Concrete Pipe, Manhole Sections, or Tile.

l. C618, Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Concrete.

s. D3034, Standard Specification for Type PSM Poly(Vinyl Chloride) (PVC) Sewer Pipe and Fittings.

w. F794, Standard Specification for Poly(Vinyl Chloride) (PVC) Profile Gravity Sewer Pipe and Fittings Based on Controlled Inside Diameter.

x. F894, Standard Specification for Polyethylene (PE) Large Diameter Profile Wall Sewer and Drain Pipe.

1.02 SUBMITTALS

A. Informational Submittals: Manufacturer’s Certification of Compliance.

PART 2 PRODUCTS

2.01 PIPE AND FITTINGS

A. As specified in the Data Sheet following “End of Section.”
PART 3 EXECUTION

3.01 INSTALLATION OF PIPE, FITTINGS, AND APPURtenANCES

A. General:

1. Reinforced concrete pipe sections connected to a manhole or structure shall be no more than 4-feet in length, as measured from the inside face of the structure to the point of flexure of the joint.
2. Pipe shall be protected during handling against impact shocks and free fall.
3. Reinforced concrete pipe shall be installed with the mark “C-76” visible on the top of the pipe.
4. Pipe laying shall proceed upgrade with spigot ends pointing in direction of flow.
5. Excavate bell holes at each joint to permit correct assembly and inspection of entire joint.
6. Pipe invert may deviate from line or grade up to 1/2 inch for line and 1/4 inch for grade, provided that finished pipe line will present a uniform bore, and such variation does not result in a level or reverse sloping invert, or less than minimum slope shown.
7. Pipe bedding shall form continuous and uniform bearing and support for pipe barrel between joints. Pipe shall not rest directly on bell or pipe joint.
8. The ends of adjoining pipes shall butt against each other for their entire circumference in such a manner that there is no shoulder or unevenness of any kind.
9. If Contractor uses batterboards instead of laser level, a top line shall be maintained over a span of three grade stakes when laying pipe. As each batterboard is erected, the top line shall be sighted to assure the accuracy of the grade stakes and the batterboards’ settings. Any errors, discrepancies, or displacement of grade stakes shall be called to the attention of the Inspector for correction.
10. Prevent entry of foreign material into gasketed joints.
11. Reinforced concrete pipe ends and rubber gaskets to be jointed shall be cleaned immediately prior to joining. Extreme care shall be taken in moving the spigot end of the pipe into the bell end of the previously laid pipe. If the gasket is damaged or moved out of place, the new pipe shall be removed and a new gasket applied before rejoining.
12. After reinforced concrete pipe has been jointed, a band at least five-and-one-half inches wide shall be placed around the outside of the pipe at the joint. This band shall serve as a form for placing 1:1 cement mortar grout in the external recess formed by the face of the groove and the shoulder of the tongue. If a reinforced paper joint band is used, it shall...
be drawn up tight around the pipe and the backfill tamped against it up to the spring line before pouring the grout. If a cloth band is used, it shall be wired around the outside of the pipe, and the grout poured before backfilling. On all pipes, the joint space remaining on the inside of the pipe shall be filled with a stiff mixture of 1:1 cement mortar which shall be troweled in place to produce a continuous, smooth, flush surface across the joint.

13. Plug or close off pipes that are stubbed off for manhole, concrete structure, or for connection by others, with temporary watertight plugs.

B. Concrete Closure Collars: Only use concrete closure collars where shown or authorized by Engineer.

3.02 SEWER CLEANING

A. Prior to final acceptance and final manhole-to-manhole inspection of the sewer system by Engineer, flush and clean all parts of the system. Remove all accumulated construction debris, rocks, gravel, sand, silt, and other foreign material from the sewer system at or near the closest downstream manhole. If necessary, use mechanical rodding or bucketing equipment.

B. Upon Engineer’s final manhole-to-manhole inspection of the sewer system, if any foreign matter is still present in the system, reflush and clean the sections and portions of the lines as required.

3.03 SUPPLEMENT

A. The supplement listed below, following “End of Section,” is a part of this specification:

REINFORCED CONCRETE

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Concrete shall have a minimum 28-day compressive strength of 6,000 psi. Four concrete cylinders or core samples shall be tested for compressive strength from each day's production, two at 7 days and two at 28 days.</td>
</tr>
<tr>
<td></td>
<td>An in-plant hydrostatic test in accordance with ASTM C361 shall be performed on each section of pipe and each pipe joint at an internal hydrostatic head of 25 feet. The joints shall be tested for a minimum period of 1 hour under constant pressure as specified. Each pipe unit that satisfactorily passes all hydrostatic testing shall bear the seal of the testing laboratory. This seal does not constitute acceptance of the pipe installation, which will be subjected to further testing and inspection in the field.</td>
</tr>
<tr>
<td></td>
<td>In lieu of the in-plant hydrostatic testing of each joint, the Contractor may substitute the following procedure: (1) Perform one in-plant hydrostatic test per day's production, in accordance with the previously specified criteria; and (2) Perform an air test on each joint in the field after assembly, in accordance with the City of Tulsa Water and Sewer Department Standard Air Test Procedure. The Contractor shall furnish all air test equipment. Testing and test conclusions shall be verified by the Engineer. The Engineer reserves the right to require additional in-plant hydrostatic testing.</td>
</tr>
</tbody>
</table>

**END OF SECTION**
SECTION 33 44 13.13
STORMWATER STRUCTURES

PART 1 GENERAL

1.01 REFERENCES

A. The following is a list of standards that may be referenced in this section:

2. ASTM International (ASTM):
   c. A615/A615M, Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.

PART 2 PRODUCTS

2.01 PRECAST UNITS

A. Conform to ASTM C478, except dimensions shall be as shown. Submit details of proposed units to Engineer for review.

B. Precast manholes shall conform to Part 314, Manholes, City of Tulsa Standard Specifications, and Standard Detail 775, Precast Concrete Stormwater Manhole.

C. Precast storm structures shall conform to Section 611, Manholes, Drop or Curb Inlets, and Junction Boxes, of the Oklahoma DOT Standard Specifications.

D. Concrete Risers for Extensions: 6 inches high maximum and of same quality as sections.

   1. Confirm acceptability of risers with Engineer before installation.
2.02 MORTAR

A. Standard premixed mortar conforming to ASTM C387/C387M, Type S, or proportion one part portland cement to two parts clean, well-graded sand which will pass a 1/8-inch screen.

B. Admixtures may be used if not exceeding the following percentages of weight of cement:
   1. Hydrated Lime: 10 percent.
   2. Diatomaceous Earth or Other Inert Materials: 5 percent.

C. Consistency of Mortar: As required to readily adhere to concrete.

2.03 MANHOLE LIDS, FRAMES, AND GRATINGS

A. Lids, Frames, and Grates for Manholes, Catch Basins and Storm Drain Inlets: Conform to City of Tulsa Standard Specifications and Standard Details.

B. Bearing Surfaces: Clean and provide uniform contact.

C. Castings: Tough, close-grained gray iron, sound, smooth, clean, free from blisters, blowholes, shrinkage, cold shuts, and defects.

D. Manhole adjusting ring shall be solid cast iron that fits in the standard City of Tulsa manhole frame and the standard manhole lid fits in the adjusting ring.

E. Adjusting rings shall conform to and be tested in accordance with the Standard Specification for Gray Iron Casings ASTM A48 and Drainage Structure Castings, AASHTO M306-89. Castings shall be Class 35-B iron and unpainted.

F. All bearing surfaces shall be machined smooth to prevent rocking and rattling.

G. The 2-inch manhole adjusting ring where specified shall have a minimum weight of 70 pounds and the 3-inch manhole adjusting ring where specified shall have a minimum weight of 100 pounds.

H. Markings on all gray iron castings shall conform to City of Tulsa Standard Specifications and Details.

I. Casting shall be traffic load rated and must pass an AASHTO proof load test that can maintain a 40,000-pound proof load for 1 minute, applied on a 9-inch by 9-inch contact area in the center of the casting. The load shall be applied at a constant rate requiring a minimum of 30 seconds to reach the 40,000-pound level. Following this test the castings shall be visually inspected for cracks or
permanent deformation which will be cause for rejection. Following this, the castings shall be loaded to failure. Cost for tensile and proof load testing shall be borne by manufacturer, and testing shall be performed at a testing facility acceptable to the Engineer. All tests shall be witnessed by the Engineer.

J. Casting dimensions shall vary by not more than plus 1/16 inch per foot.

K. Only those castings which have been approved by the City will be permitted. Approval for each casting shall consist of approved Shop Drawings, plus laboratory test reports of the tensile test and load test.

PART 3 EXECUTION

3.01 EXCAVATION AND BACKFILL

A. Excavate as required to accomplish construction. Backfill as specified for adjoining pipe trench.

3.02 PLACING PRECAST UNITS

A. Excavate and backfill trench bottom to required grade with 1-1/2-inch minus crushed rock uniformly graded from coarse to fine and with sufficient fines for proper compaction. Set units to grade at locations shown.

B. No more than 8 inches of concentric rings shall be used to bring manholes to finished grade.

3.03 EXTENSIONS

A. Install watertight extensions as shown. Lay risers in mortar with sides plumb and tops to grade. Seal joints with mortar, with interior and exterior troweled smooth. Prevent mortar from drying out and cure by applying a curing compound.

3.04 INSTALLATION OF FRAMES AND GRATES

A. Set frames and grates at elevations indicated or as determined in field and in conformance with Drawings.

B. Frames may be cast in, or set in mortar.

3.05 CLEANING

A. Upon completion, clean structure of silt, debris, and foreign matter.

END OF SECTION
SECTION 33 46 00
SUBSURFACE DRAINAGE

PART 1   GENERAL

1.01   GENERAL

   A. This section covers requirements for subsurface drainage piping, cleanouts used to control shallow groundwater elevations within the Project area.

1.02   REFERENCES

   A. The following is a list of standards which may be referenced in this section:

      1. American Association of State Highway and Transportation Officials (AASHTO):

      2. ASTM International (ASTM):
         e. D422, Standard Test Method for Particle-Size Analysis of Soils.
         h. F449, Standard Practice for Subsurface Installation of Corrugated Polyethylene Pipe for Agricultural Drainage or Water Table Control.
         i. F667, Standard Specification for Large Diameter Corrugated Polyethylene Pipe and Fittings.

1.03 DEFINITIONS

A. Cleanouts: Surface access ports used to access drain lines and constructed of solid corrugated piping.

B. Drain Lines: Buried perforated pipe providing collection and conveyance of drain water from saturated soils.

C. Granular Drain Material: Granular material used as an envelope around drain lines to provide pipe bedding, a permeable drainage zone, and stabilization of base soils to prevent migration of fines into drain lines.

1.04 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Product Data: Drain line pipe and fittings.

B. Informational Submittals: Final drain line inspection and cleaning certification of compliance.

1.05 QUALITY ASSURANCE

A. Granular Drain Material Source:

1. Sampling:
   a. Conduct sampling of granular drain material source under supervision of Engineer in accordance with ASTM D75.
   b. Samples shall be representative and be clearly marked to show source of the material.
   c. Testing:
      1) In accordance with ASTM D1140 to determine percentage of fines.
      2) In accordance with ASTM D422 to determine gradation of particles larger than No. 200 sieve.
   d. Acceptance:
      1) Based on inspection of source by Engineer.
      2) Certified test results.

PART 2 PRODUCTS

2.01 UNDERDRAIN

A. Underdrain lines shall be perforated, unless otherwise noted on Drawings.
B. Perforated Underdrain Lines:

1. PVC in accordance with ASTM F758 for Smooth-Wall PVC Plastic Underdrain Systems for Highway, Airport and Similar Drainage.
2. The nominal diameter of the underdrain is 6 inches or as indicated on Drawings.
3. The minimum number of rows of perforations is 4 rows but may have more than 4 rows.
4. The minimum perforated hole diameter is 3/8 inch with a spacing of 3-1/4 inch. The underdrain pipe shall provide a minimum inlet area greater than 0.220 square inches per linear foot of pipe.

C. Nonperforated Underdrain Lines:

1. PVC conforming to ASTM D2729, PVC Sewer Pipe and Fittings.
2. Ductile Iron conforming to ASTM A746, Ductile Iron Gravity Sewer Pipe.

D. Underdrain Line Fittings:

1. Includes cleanouts, elbows, tees, branch connections, end caps, and reducing couplers.
2. Conforming to ASTM D2729, ASTM D3034, and ASTM F758, as appropriate.
3. Cleanout end cap shall have a metal locating plate attached as shown on Drawings.
4. Diameter of cleanout fittings shall be as shown on Drawings.

2.02 NONWOVEN GEOTEXTILE

A. Nonwoven geotextile in accordance with Section 31 32 19.16, Geotextile.

2.03 GRANULAR DRAIN MATERIAL

A. In accordance with Section 31 23 23.15, Trench Backfill.

2.04 TRENCH BACKFILL

A. As shown on Drawings.

PART 3 EXECUTION

3.01 TRENCH EXCAVATION

A. Excavate to lines and grades shown on Drawings allowing required thickness of granular fill to be placed around drain lines as shown on Drawings.
3.02 UNDERDRAIN LINE INSTALLATION

A. Pipe Installation:
   1. Lay drain lines and appurtenances to lines and grades shown on Drawings.
   2. Take special precautions on hot days to ensure stretch limit is not exceeded and excessive deflection is not caused by premature backfilling.

B. Fitting Installation:
   1. For nonstandard connections, join drain lines using manufacturer’s printed recommended methods to complete connection.
   2. Drain lines that are exposed to make a connection after trench backfilling shall have 4 inches of granular drain material replaced around drain line and connection.

3.03 GRANULAR DRAIN MATERIAL INSTALLATION

A. Place granular drain material around perforated drain lines as shown on Drawings.

B. Place granular drain material around perforated drain lines in a continuous operation during placement of drain lines.

C. Place granular drain material with spreader boxes or other equipment in a manner to minimize segregation.

3.04 GEOTEXTILE INSTALLATION

A. Place non-woven geotextile in trench as shown on Drawings.

B. Installation of geotextile shall be in accordance with Section 31 32 19.16, Geotextile.

3.05 TRENCH BACKFILL

A. Trench shall not be left open overnight; plug end of drain lines and backfill trench to prevent animals, sediment, or debris from entering pipe.

B. Perform in a manner that shall minimize settlement.

C. Backfill may be placed automatically by trencher.
Where backfill material is placed in drain line trenches mechanically, backfill material shall be pushed onto slope of backfill previously placed and allowed to slide down into trench. Backfill shall not be pushed into trench in such a way as to permit free fall of material until at least 2 feet of cover has been provided over the top of drain line.

Place in such a manner to prevent displacement of drain line and granular fill after backfilling.

Unless otherwise directed by Engineer, procedures for compaction of trench backfill material shall be accomplished by close of each day’s work.

3.06 CLEANING ACCESS INSTALLATION

A. Install inline cleanouts, end-of-line caps as shown on Drawings.

B. Install cleanouts as shown on Drawings.

C. Install end-of-line caps at upstream end of drain lines.

3.07 FINAL INSPECTION AND CLEANING

A. Preparation:
   1. Do not begin jet washing until subsurface drainage work is complete.
   2. Stage the Work to provide adequate supply of water for jet washing to allow inspection and cleaning of each section of drain line in one continuous operation.
   3. Access to drain lines shall be through drain line cleanouts or the manholes.

B. High Pressure Jet Washing Equipment:
   1. Suitable type and size to perform cleaning specified herein.
   2. Cleaning nozzle capable of jet washing 6-inch diameter drain lines in sections up to 1,000 feet long.
   3. Capable of negotiating 6-inch diameter cleaning access point.
   4. Jet mechanism shall have a forward-piercing jet with trailing side jets that propel mechanism forward.
   5. Operating pressures at pump shall not exceed a maximum of 2,300 psi.
   6. Operate in accordance with manufacturer’s printed instructions, recommendations, and best practice of the trade.

C. When drain lines must be jet washed in sections, upstream sections shall be jet washed before connecting section downstream.
D. If tailwater produced is not clear, run jet cleaner through drain line section up to two more passes.

E. Obstructions within drain lines, collapsed drain line sections, or sections outside allowable tolerances for grade that are identified during final inspection and cleaning shall be repaired and corrected to meet Specification.

F. Complete final drain line inspection and cleaning certification of compliance addressing the following items:

1. Dates of work, equipment, and personnel performing work.
2. Locations and descriptions of obstructions, collapsed sections, out-of-grade sections, and actions taken to repair problems.
3. Locations of sections where tailwater did not run clear after three passes.

G. After completing jet washing for a drain line, restore area to a neat and finished appearance.

END OF SECTION
SECTION 35 20 16.25
FABRICATED STOP LOGS

PART 1  GENERAL

1.01  REFERENCES

A. The following is a list of standards which may be referenced in this section:

   1. ASTM International (ASTM):
      a. A193/A193M, Alloy-Steel and Stainless Steel Bolting Materials for High Temperature or High Pressure Service and Other Special Purpose Applications.

1.02  SUBMITTALS

A. Action Submittals:

   1. Shop Drawings:
      a. Manufacturer’s catalog information, descriptive literature, specifications, and identification of materials of construction.
      b. Detailed structural drawings showing the equipment fabrications and interface with other items. Include dimensions, size, and locations of connections to other work, and weights of associated equipment associated therewith.

B. Informational Submittals:

   1. Manufacturer’s Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements.
   2. Special shipping, storage and protection, and handling instructions.
   3. Manufacturer’s written/printed installation instructions.
   4. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.
5. Manufacturer’s Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers’ Field Services.

1.03 SYSTEM DESCRIPTION

A. See Drawings and Schedule for stop log locations. Stop logs may be installed and removed by crane from adjacent bank.

1.04 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following spare parts and special tools:

<table>
<thead>
<tr>
<th>Item</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Special tools required to maintain or dismantle</td>
<td>One complete set</td>
</tr>
</tbody>
</table>

B. Delivery: In accordance with Section 01 61 00, Common Product Requirements.

PART 2 PRODUCTS

2.01 SUPPLEMENTS

A. See supplements to this section for additional product information.

2.02 MATERIALS

2.03 ALUMINUM STOP LOGS

A. Logs:

1. 12-inch-high horizontal sections suitable for vertical stacking.
2. Interchangeable, so they can operate in any order of placement.
3. Designed for channel size and differential head shown on the schedule.

B. Assembly:

1. Log sections with stiffeners and lifting bolts.
2. Stainless steel guides for block out in concrete abutments, logs to slide smoothly in the vertical guides.
3. Lifting device with latch to engage and disengage logs, suitable for attaching to an overhead hoist, crane, or cable. Weld lifting brackets to stop logs.
4. Edges of Log Sections: Parallel to each other, with sides at right angles to the bottom.

C. Seals:

1. Resilient seal shall be on the bottom of each log and vertically continuous on the guide, not on the logs.
2. Seal strips for stop log guides to ensure leakage rate in accordance with AWWA C562.

2.04 APPURTEINANCES

A. Lifting Lugs: Furnish suitably attached for equipment assemblies and components weighing over 100 pounds.

2.05 SHOP/FACTORY FINISHING

A. Mechanically descale and passivate all weld burn and weld slag in accordance with ASTM A380 to provide uniform finish.
B. Coat all aluminum surfaces in contact with concrete with unthinned bitumastic paint in accordance with Section 09 90 00, Painting and Coating, or insulate with suitable protective neoprene gasket material.

PART 3 EXECUTION

3.01 INSTALLATION

A. In accordance with the manufacturer’s written instructions.

3.02 MANUFACTURER’S SERVICES

A. See Section 01 43 33, Manufacturers’ Field Services, and Section 01 91 14, Equipment Testing and Facility Startup.
B. Provide manufacturer’s representative at Site in accordance with Section 01 43 33, Manufacturers’ Field Services, for installation assistance, inspection and certification of proper installation, equipment testing, startup assistance, and training of Owner’s personnel for specified component, subsystem, equipment, or system.
3.03 SUPPLEMENT

A. The supplement listed below, following “End of Section,” is a part of this Specification.

1. Stop Log Schedule.

SECTION 35 20 25B
INSTALLATION OF OWNER-FURNISHED PNEUMATIC GATE SYSTEMS

EQUIPMENT AND COMPONENT NUMBER(S)

Air Compressor 1: 030-AC-01.
Air Compressor 2: 030-AC-02.
Air Compressor 3: 030-AC-03.
Dryer 1: 030-AD-01.
Dryer 2: 030-AD-02.
Dryer 3: 030-AD-03.
Pneumatic Gate Control Panel.
Pneumatic Gate Mechanical Valve Panel.

PART 1 GENERAL

1.01 SUMMARY

A. This Section covers the Work and materials necessary for the delivery, installation, and startup for the pneumatic gate compressed air supply, and control systems for operation of the pneumatic gates, and WaveShaper features as dimensioned on Drawings. The specific design and fabrication details for all materials and equipment shall be the responsibility of the Pneumatic Gate System Supplier. Drawings and Specifications are provided to clarify gate performance requirements contained in the Section. Shop Drawings shall be submitted as specified herein.

1.02 SCOPE OF SUPPLY

A. Items to be supplied by the Gate System Supplier are described in the Prepurchase Contract.

B. Items to be supplied and Work to be performed by the Installation Contractor include (but are not limited to) the following:

1. Verify conditions.
2. Provide concrete work as shown on Drawings.
3. Provide and install air supply pipe. This includes, but is not limited to:
   a. Encased AHP lines from Compressor Building to gates.
   b. AHP lines in gate structure which terminate as specified by the gate manufacturer for connection to the air bladders.
   c. AHP vent lines and purge valves as shown on Drawings.
4. Coordinate routing of air supply piping between Compressor Building and the gates to maintain slope as required by Gate System Supplier.
5. Install anchor bolts.
6. Install the pneumatic gate system including air bladders, gate panels, and other related components.
7. Install all compressed air supply equipment in accordance with equipment manufacturer’s requirements and as shown on Drawings, and Gate Suppliers Shop Drawings.
8. Design and install air supply pipe support systems in accordance with Section 01 88 15, Anchorage and Bracing.
9. Install abutment plates, including grouting.
10. Install all pneumatic crest gate control equipment.
11. Provide and install all electrical conduit, wiring, junction boxes, and fiber optic cables as shown on Drawings.
12. Provide and install all control conduit, cable and junction boxes as shown on Drawings.
13. Commission, and test gates in conjunction with Gate System Supplier’s technical support staff.
14. Provide Neversieze or other approved lubricating compound for all stainless steel anchor bolts and fasteners.
15. Provide 100 percent silicone caulk for all interpanel seals, as needed.

1.03 ENVIRONMENTAL REQUIREMENTS

A. Outdoor Temperature: Maximum 110 degrees F; minimum minus 10 degrees F.
B. Humidity: Maximum 100 percent relative humidity; minimum 30 percent relative humidity.
C. Atmosphere: If located outdoors, equipment is subject to rain, ice, wind, and snow.
   3. Mean Annual Dissolved Solids Concentration: 1,101 mg/L.
   4. Chloride Concentration: Greater than 250 mg/L more than 50 percent of the time.

1.04 SUBMITTALS

A. Action Submittals:
   1. See Section 01 64 00, Owner-Furnished Products.
2. Anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. See Section 01 64 00, Owner-Furnished Products.
2. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
3. Field test reports for each functional and performance test of equipment.
4. Manufacturer’s Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers’ Field Services.

1.05 DELIVERY, STORAGE, AND HANDLING OF EQUIPMENT AND MATERIALS

A. Coordinate with Owner, Engineer, and Gate System Supplier in accordance with Prepurchase Contract and Section 01 64 00, Owner-Furnished Products.

PART 2 PRODUCTS

2.01 GENERAL

A. See Section 01 64 00, Owner-Furnished Products, Gate System Supplier Shop Drawings and Contract Drawings.

2.02 MATERIALS

A. Coordinate all penetrations for air piping, cable, and fiber.

B. Provide anchorage of equipment as required in Section 01 88 15, Anchorage and Bracing.

C. Support piping internal to the building in compliance with Section 40 05 15, Piping Support Systems, Anchorage and Bracing.

2.03 CONTRACTOR-SUPPLIED PRODUCTS

A. Provide all products required to complete the Work under this section, except where specifically designated as provided by the Gate System Supplier. This designation is clearly defined on Drawings and Procurement Contract provided as a Supplement. Such products may include, but are not limited to, connecting piping and valves, instrument isolation valves, pipe hangers and supports, wiring, piping accessories, specialties, miscellaneous hardware, finish painting, coatings and expendable materials, all as necessary to provide a complete and properly functioning system.
B. Provide incidental product, such as gaskets, supports, bolts, and lubricants, as shown and as required for proper operation of equipment installed under this section. Products shall conform to applicable sections of these Specifications for the intended service.

C. Furnish anchor bolts, fasteners, washers, etc., and templates needed for installation of the Gate System Compressors.
   1. Verify the number and size of anchor bolts required to install the Gate System equipment and all accessories furnished by the Gate System Supplier and furnish all necessary anchor bolts.
   2. Size and locate anchor bolts in accordance with Gate System Supplier Shop Drawings and installation instructions.
   3. Anchor bolts, fasteners, washers, etc., shall be Type 316 stainless steel in accordance with Section 05 50 00, Metal Fabrications.

D. Equipment Foundation Pads: Provide foundation pads for equipment as required. Approximate pad sizes are shown on Drawings. The Contractor shall verify exact dimensions and configuration of all pads, including penetrations, with Drawings, and Gate System equipment Shop Drawings.

E. Compressor Air Supply and Exhaust Ducts: Provide ducts in the Compressor and Control Building as shown on Drawings.

F. Field Installed Piping: Furnish all piping as shown on Drawings, in accordance with Section 40 27 00, Process Piping—General.

G. Provide all conduit, conductors, fiber, and terminations as shown on Drawings.

PART 3  EXECUTION

3.01 INSTALLATION
   A. The equipment specified herein shall be located as indicated and installed in conformance with the manufacturer’s suggested method as approved. Contractor shall provide such additional incidental materials and labor as required for a complete and proper installation.

3.02 FIELD FINISHING
   A. Factory-Finished Equipment: Repair damaged surfaces using manufacturer’s paint touchup kit.
3.03 FIELD QUALITY CONTROL

A. Prior to startup, all equipment shall be tested and inspected for proper alignment, quiet operation, proper connection, and satisfactory performance in conformance with Section 01 91 14, Equipment Testing and Facility Startup.

B. Functional Tests: Coordinate with Gate System Supplier as described in the Procurement Contract.

C. Performance Tests: Coordinate with Gate System Supplier as described in the Procurement Contract.

END OF SECTION
PART 1  GENERAL

1.01  SCOPE OF WORK

A.  General: There shall be designed, furnished and installed adjustable WaveShapers™ and Gates to adjust and control the shape of waves in the waterway and, where shown, control upstream water levels and flow rates into waterways. These shall collectively be referred to as gates. The equipment shall include plates, hinges, racks, hydraulic cylinders, rubber bladders, hinges actuators, valves, seals, and control panels as schematically shown on Drawings. A hydraulic system including cylinders, valves, reservoir and hydraulic pump, and a pneumatic system, including a compressor, bladder, valves and piping to move the gates are referred to as the “actuators.”

B.  Related Work:

1.  Section 01 45 33, Special Inspection, Observation, and Testing.
2.  Section 05 50 00, Metal Fabrications.
3.  Section 31 35 00, Start-Up and Tuning.

1.02  SUPPLIER

A.  The equipment specified in this Section shall be as designed and supplied by Obermeyer Hydro, Inc. (Gate System Supplier), telephone: (970) 568-9844. The Gate System Supplier shall have previously designed, manufactured, and supplied equipment similar in function and size and have at least 15 years’ experience. All reinforced rubber components shall be fabricated in the Gate System Supplier’s own facilities. Substitute equipment, if allowed, must be modified as necessary to provide the specified gates and to meet the specified operating conditions. The Gate System Supplier shall have expertise in the hydraulics of flow that impacts the gates.

1.03  QUALITY ASSURANCE

A.  References: Reference in this Section of a Standard, such as ASTM, AWWA, or ACI, is to be interpreted to be the latest revision of that Standard.
B. Industry Standards and Specifications:

1. American Society for Testing and Materials:
   b. A53: Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless.
   d. A153: Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
   e. A181/A181M: Forgings, Carbon Steel for General Purpose Piping.
   g. A536: Ductile Iron Castings.
   h. D751: Coated Fabrics, Test Method.
   i. D1149: Rubber Deterioration – Surface Ozone Cracking in a Chamber (Flat Specimens), Test Method.

4. Obermeyer Hydro, Inc.: The gates and controls shall meet the requirements of Obermeyer Hydro, Inc.

1.04 SUBMITTALS

A. Submit the following in accordance with requirements presented in The Gate Prepurchase Specifications:

1. Final design drawings, computations and engineering analysis of gates prior to commencement of Shop Drawings, fabrication submittals and fabrication of gates. Design Loads, including dead loads, safety factors, etc. are to be included. Drawings, computations and engineering analysis are to be sealed by a licensed Professional Engineer. Shop drawings shall detail all connections, fabrication details, final dimensions, clearances, tolerances, finishes, etc. An anchor bolt template shall also be shown on the Shop Drawings and shall be furnished unless waived in writing by the Engineer.

3. Handling and storage plan and requirements, prior to delivery of gates, and any components to the project site. Written instructions from manufacturer will be provided.
4. The Installation Contractor shall be responsible for following the manufacturer’s installation and storage instructions, as approved by the Engineer, until acceptance by the City. No equipment shall be delivered unless such instructions have been approved by the Engineer.

5. Work plan and schedule for construction by Installation Contractor, including foundation work, anchors, concrete forming and steel placement, placement of embeds and anchors, hydraulic lines and sensing piping, special concrete work to fill areas of difficult placement, concrete finishing and placement, testing of anchor bolts, work area plan for placement, detailed sequential steps of placement, equipment for placement, controls and sensing line installation, and all testing procedures.

6. Specific minimum tolerances required by manufacturer for construction of reinforced concrete, painting, torque for anchor bolts and fasteners, pressures, deadbands, dimensions and related construction. Manufacturer’s requirements do not supersede other stricter requirements elsewhere in these specifications and as shown on Drawings.

7. Written instructions regarding concrete embedded anchor system hardware, to include tolerances, 30 days prior to anticipated delivery of the concrete embedded anchor system hardware.

8. Installation and Operations Inspection Report by Gate System Supplier: Equipment manufacturer, or their authorized representative, shall submit a written report with respect to the equipment certifying that: (1) the equipment has been properly installed and lubricated under their supervision, (2) the equipment is in accurate alignment, (3) they were present when the equipment was placed in operation, (4) the equipment has been operated and inspected under full load conditions and operated satisfactorily, (5) they are fully covered under the terms of the guarantee. Report(s) shall include report from on-site inspection by Gate System Supplier. Inspections will be periodic as required for installation of critical components or at critical times. At least one inspection report approving installation of each gate prior to running water over the fate during the construction dewatering phase. The Engineer shall be informed of the date for each inspection at least 2 weeks prior to all onsite inspections by the Gate System Supplier. Refer to Article Installation for additional details.

9. Leakage Test Records prior to final inspection by Engineer.

1.05 DELIVERY, STORAGE, AND HANDLING OF EQUIPMENT AND MATERIALS

A. Insofar as is practical, the equipment specified herein shall be factory assembled. The parts and assemblies that are, of necessity, shipped unassembled shall be packaged and tagged in a manner that will protect the equipment from damage and facilitate the final assembly in the field. Generally, machined and unpainted parts shall be protected from damage by the elements of weather with the application of a strippable protective coating.

B. Box, crate, or otherwise enclose and protect equipment during shipment, handling, storage, and following installation so as to ensure the preservation of the required quality and fitness of all materials and equipment until final acceptance of the project. Keep equipment dry and covered from exposure to weather. Store pumps, motors, electrical equipment, controls, insulation, and equipment having anti-friction or sleeve bearings in weather-tight storage facilities. Lift large equipment items only at the points designated by the manufacturer. Protect factory painted surfaces against impact, abrasion, discoloration, and other damage. Repair damage as directed and approved.

1.06 WARRANTY

A. The Gate System Supplier shall provide a 5-year warranty on the gates commencing at final acceptance of the Work. The warranty shall cover all manufactured and supplied components and parts and include on-site assessment, removal, and replacement. Dewatering efforts are not included in the warranty and shall be the responsibility of the Owner.

B. In addition to the general warranty requirements, the equipment warranty shall cover (1) faulty or inadequate design by the equipment manufacturer; (2) improper assembly or fabrication; (3) defective workmanship or materials, and (4) leakage, breakage or other failure. It shall be the gate System Supplier’s responsibility to ascertain the conditions and service under which the equipment will operate and to warrant that operation under those conditions shall be successful. The supplier shall furnish a copy of the warranty to the City of Tulsa with the City named as beneficiary. Any defects or failure within the warranty period shall immediately be repaired or replaced by the Gate System Supplier.

1.07 DESIGN

A. The shape, dimensions, some details and range of motions of gates are as specified on Drawings. Design efforts by the Gate System Supplier shall include structural analysis and hydraulic modeling if required. The Gate System Supplier shall provide a detailed, working 3D model of the gates in Rhinoceros 3D (computer application) or other acceptable similar program.
This shall be fully moveable and readily able to demonstrate the range of motion and verify the absence of interference of the various components and structural members.

1.08 GATE DESCRIPTION

A. Gates shall consist of composite panels with elastomeric hinges anchored to concrete and elastomeric hinges between composite panels where shown on Drawings. There are two types of WaveShapers in the project – Entrance Gates with WaveShaper and WaveShapers. Entrance Gate with WaveShapers control both the upstream water levels and the downstream waves with an upstream crest/pneumatic gate panel that is hinged to both the concrete and to one of the downstream panels that comprise the WaveShaper gate. WaveShapers only control the formation of waves downstream with panels hinged to the concrete. Crest gate panels shall be actuated with a pneumatic system and be fully compatible with the hydraulic system actuating the WaveShaper gates. Actuators for WaveShaper gates shall include hydraulic cylinders mounted between the hinged gate panels and the concrete foundations. The elastomeric hinges and actuators shall allow the gates to operate through a range from fully raised to fully lowered and as otherwise shown on Drawings.

B. Operational Requirements:

1. The Gate Control System operational requirements shall be in accordance with Section 40 99 90, Package Control Systems, including operational control strategy.
   a. WaveShaper Gate Controls.

1.09 HYDRAULIC LOADING

A. The Gates and WaveShapers, including attachments, hinges, bearings, and connectors, shall be analyzed and designed using the loadings and considerations shown in the figures below and as described herein. The moveable panels that make up the WaveShapers and Gates shall be designed to move within the limits as shown on Drawings with water flowing in the waterway. The general shape of the WaveShapers and Gates are shown schematically, and the overall dimensions and shape shall not be changed significantly.

B. The WaveShaper gates will be in a rapidly varying flow regime (transition from super critical to subcritical flow) at a hydraulic jump. Depending on the hydraulic jump formation the gate will experience downward or upward (uplift) loading. The WaveShaper gate and system components (including actuators) shall be designed to withstand the loads shown in the table below. Loads shown do not include dead loads, and do not include a safety factor.
Gate System Supplier shall assign an appropriate safety factor based on their experience with similar systems.

Notes:
- Alternative loading than shown above: All pneumatic air bladders and attached panels shall withstand a differential upstream and downstream head of 8 feet.
- All pneumatic air bladders shall be equipped with a valve that will deflate when the load is within 75 percent of the given design load.

1.10 OTHER LOADING

A. The Gate System Supplier shall evaluate and include in the design other loads on the system, including momentum, impact, shear, dead loads, actuator dynamic loads, and others identified by supplier based on experience with
similar systems. Gate System Supplier shall also consider operational loadings such as when the waterway is filling or draining during startup and shutdown.

1.11 UNEQUAL CYLINDER LOADING

A. The gates, including the frame, panels, cylinders, connections, pivots, and attachments, shall be designed so as to accommodate an unequal loading of any individual cylinder of 50 percent of its maximum design loading without excessive deflection or stresses of the gate, including the frame, connections, supports, pivots, clevises, etc.

PART 2 MATERIALS

2.01 GATE CONTRACTOR SUPPLIED COMPONENTS

A. The gates and all necessary ancillary components required to allow successful operation of the gates shall be provided by Obermeyer Hydro, Inc. of Fort Collins, Colorado (Contractor/Gate System Supplier). All equipment provided by the Gate System Supplier shall be Class 1, Division 2, Group D compliant. Equipment to be so provided includes, but is not limited to, the following:

1. Final design drawings and calculations, shop drawings, computer modeling (if conducted) results and engineering analysis of gate system forces prior to commencement of fabrication of the gate.
2. Steel gate panels and associated piping attachments.
4. Seals with attachment hardware.
5. Gate clamping hardware with anchor bolts, nuts, and washers.
6. Pneumatic system including compressor, bladders, connections, embedded items, valves, and control components (see Section 35 20 25B, Installation of Owner-Furnished Pneumatic Gate System).
7. Hydraulic system controls including hydraulic pump and reservoir, all valves and control components.
8. The hydraulic cylinders including all bearings, attachments, pivots, flexible hoses that attach from the cylinders to the stainless steel hydraulic lines, attachment fittings, clevises, etc.
9. Inclinometers with LCD output display.
10. Ultra High Molecular Weight (UHMW) polyethylene abutment plates with Type 316 stainless steel anchor bolts, nuts, and washers.

2.02 STEEL COMPONENTS

A. Hinge retainers, splitters, and restraining strap clamps will be manufactured from Type 316 stainless steel.
B. Other non-structural components to be manufactured from Type 316 stainless steel.

C. All threaded fasteners, including anchor bolts and attachment hardware, shall be Type 316 stainless steel, or approved equal. Anchor bolt allowable shear and tension stresses for attachment to concrete shall not exceed that recommended by the anchor bolt manufacturer.

D. Stainless steel plates and other stainless items shall be Type 316 stainless steel, or approved equal.

E. All steel and Type 316 stainless steel components shall be designed so that the maximum stress level in each component is less than 40 percent of yield strength and less than 25 percent of ultimate strength.

F. All attachment hardware shall not protrude above adjacent surfaces. All bolts on exposed faces of steel gates shall be countersunk flush to surface.

G. All welds and edges shall be ground smooth.

2.03 EDGES AND GAPS

A. Exposed edges on gates shall have a minimum radius of 2 inches as shown on Drawings. All other exposed edges on all panels, hinge attachments, steel, etc., shall be rounded to no less than 1/4 inch. Edges of panels and hinges shall have no gaps between gate panels/frames and concrete walls greater than 1/4 inch. All gaps between gate panels and concrete walls shall be filled with rubber securely attached to the frame to prevent fingers or lose articles of clothes from becoming entrapped.

2.04 INCLINOMETERS/TILT GAUGES

A. Inclinometers shall be accurate to at least 0.5 degree, be reliable and suitable for river conditions and be as supplied by Obermeyer Hydro, Inc. The inclinometers shall be mounted so as to facilitate maintenance and replacement.

B. Inclinometers (a total of twenty) shall be installed on:

1. Ten hydraulic gate panels to provide feedback signal to display the angle/slope in the upstream to downstream orientation of the panel to the operator.
2. Two pneumatic gate panels as shown on Drawings.
2.05 HYDRAULIC CYLINDERS AND ATTACHMENTS

A. Cylinders shall be double acting and designed to support the entire design hydraulic loads, dead loads, and other loads. The cylinders and all hardware shall be designed for submerged conditions and for vegetable oil based hydraulic fluid. Cylinders shall have a stainless steel body. The cylinders shall have an operating pressure of no more than 3,000 psi. All bolts, rods, clevises, rod eyes, pivoting hardware, and all other hardware shall be Type 316 stainless steel. Seals shall be designed for vegetable oil operation and submerged conditions. Cylinder supports, pivots, clevises, etc. shall be designed to allow for inaccuracies in construction, unequal loadings, etc. so as to not put any non-axial loading or moment on the hydraulic cylinders. Both cylinder mounts shall be spherical connections. Cylinders shall be provided with a 5-year manufacturer’s warranty.

2.06 WAVESHAPER HYDRAULIC SYSTEM

A. The hydraulic system supplying and controlling the hydraulic cylinders of the WaveShaper Gates shall provide smooth, reliable, and efficient operations of the WaveShaper Gates. The hydraulic system shall be designed so that there is not a loss of hydraulic pressure over time and that the cylinders and the gate panels stay in-place when the system is turned off or unattended.

1. Hydraulic Fluid: The hydraulic system will be supplied and all components designed to operate with vegetable base hydraulic fluid. Hydraulic fluid shall be readily and totally biodegradable, maintain low viscosity at minus 20 degrees F, and be stable for a period longer than 25 years. Base fluid shall be canola (rapeseed) oil as manufactured by Hydro Safe® Oil Division, Inc., or approved equal. The grade shall be as determined for the application. Twenty gallons of additional fluid for future use shall be supplied.

2. Hydraulic Line: Hydraulic Line (tubing) shall be 3/8-inch diameter Type 316 stainless steel with a minimum wall thickness of 0.049 inch and a maximum working pressure of greater than 3,000 psi. Fittings shall be stainless steel with equivalent or greater strength than the tubing. Hydraulic hoses shall be rated for a working pressure of 3,000 psi and be attached with stainless steel quick connects and stainless steel fittings, or approved equal. Hose and fittings shall be approved for Marine Applications (SAEJ1942), and shall be Global M3K Mega3000® Hose – SAE 100R17, or approved equal. Where routed under lip plates, tubing shall be fastened to the gate support slab at no greater than 4 feet intervals with stainless steel straps. All hoses shall be protected with stainless steel anti-abrasion sleeves or wraps.
3. Hydraulic Control Valves: Valves shall be the directional control type with a single lever operator per gate. Valves shall operate such that in one position the gates raise, in the other position the gates are lowered, and the hydraulic cylinders do not move when the valve is in the neutral position.

4. Valves: Ball and check valves shall be Type 316 stainless steel.

5. Pressure Relief Valves (PRV) Valves: PRV valves in the hydraulic system of the WaveShaper Gates shall release pressure so as not to allow over pressuring of any cylinder at any time. PRV valves shall be self-actuated safety valves designed to relieve excess upstream pressure from the line. The PRV valves shall be adjustable from 1,000 psi to 3,000 psi. The PRV valves shall be connected to a drain valve so that hydraulic fluid is released back to the hydraulic pump reservoir.

6. Hydraulic Pump: The Gate System Supplier shall supply a hydraulic pump capable of operating the hydraulic cylinders required to operate the WaveShapers. The pump single speed with a minimum reservoir capacity equal to at least 1.5 times the difference between the volume of hydraulic fluid between all cylinders up and all cylinders down. It shall have a maximum operating pressure of 3,000 psi. The pump shall be capable of lifting WaveShaper panels at full range within 2 minutes but not faster than 1 degree of gate rotation per second. The pump shall have a pressure regulating valve to adjust the maximum operating outlet pressure from 1,000 psi to 3,000 psi. The pump shall be designed to work with vegetable based hydraulic fluid.

7. Hydraulic Valves and Manifold: The hydraulic valves and manifold shall be neatly arranged into a well and uniform layout control panel. The valves shall be labeled as to each cylinder that they control. Valving system shall be designed to isolate the individual WaveShaper gate cylinders at each hydraulically actuated drop/feature for future operation and maintenance.

8. Pressure Gauge: Provide liquid filled pressure gauge manufactured by Ashcroft, or approved equal rated per the maximum system pressure operating pressure. Include an isolation valve between gauge and hydraulic system.

2.07 PNEUMATIC GATE SYSTEM

A. The pneumatic gate system supplying and controlling the air bladders of the Entrance Gates with WaveShaper Gates shall provide smooth, reliable, and efficient operations of the gates. The pneumatic system shall be designed so
that there is not a loss of air pressure over time and that the bladders and the
gate panels stay in-place when the system is turned off or unattended.

B. The pneumatic air system, including but not limited to, the pneumatic air
system, air bladders, airlines, and other system appurtenances shall meet the
requirements and be integrated with the pneumatic air system specified in
Section 35 20 25B, Installation of Owner-Furnished Pneumatic Gate System.
If conflicts arise, the more restrictive criteria shall apply, however the
Engineer will be notified of any inconsistencies or discrepancies.

2.08 UHMW POLYETHYLENE ABUTMENT/SKID PLATES AND J BULB SEALS

A. All panels including the crest panels and all panels that make up each
WaveShaper shall have adjustable J bulb seals (or reinforced rubber spacers)
along all outside edges that abut to the abutment walls. All abutment walls
shall have UHMW abutment plates embedded in the walls. The plates shall be
set parallel and flat so as to allow for sealing with the J bulb seals. The
UHMW abutment plates shall be designed so as to allow for eventual 1/2-inch
degradation of the concrete surface of the concrete abutment walls adjacent to
the plates (i.e. design the thickness and anchoring of the abutment/skid plates
to adequately account for this potential concrete degradation).

2.09 WAVESHAPER RACKS

A. Type 1: The WaveShaper Type 1 Racks shall be installed on the Entrance
Gate WaveShapers and shall consists of a heavy steel frame with sections of
rounded polyethylene bars attached to the heavy steel frame. The weight of
the rack is important to prevent inadvertent “floating” due to strong currents
as experienced at other installations.

1. The polyethylene bars shall have a maximum 2-inch clear opening
between 1/2-inch-thick or thicker polyethylene bars. The section of
polyethylene bars shall be similar and equal to those manufactured by
Hydrothane Systems, Inc. The bars and connectors shall be designed for
a minimum of 120 pounds per square foot loading.
2. One section of polyethylene bars shall be readily removable for
maintenance access.
3. All exposed rack components shall be smooth with edges rounded. See
Drawings for details.
4. All rectangular steel sections shall have a minimum wall thickness of
3/8-inch-thick.
5. The steel frame shall be grout-filled, Type 316 stainless steel as shown
on Drawings.
6. All rectangular steel sections shall be sealed watertight to prevent internal corrosion and filled with linseed oil. Fill plugs will be installed as required.
7. All connectors shall be Type 316 stainless steel.
8. The clearance between the bottom portion of the frame and foundation surface shall be from 4 inches.
9. No sharp edges shall be created on the exposed surface of the rack including but not limited to the hinge with the WaveShaper and the joint between the steel frame and the polyethylene bar rack sections.

B. Type 2: The WaveShaper Type 2 Racks shall be of the bar screen style, having a 4-inch or less clear openings between all bars and sides.

1. Type 2 racks including all connectors will be constructed of Type 316 stainless steel. Pipe shall be Schedule 40 or Schedule 80 as shown on Drawings.
2. The clearance between the bottom portion of the frame and foundation surface shall be from 4 inches.
3. The bar racks shall be designed to allow the gates to be rotated down to allow access during maintenance.
4. See Drawings for details.

2.10 REMOVEABLE ACCESS PLATES

A. A total of four steel removable access plates and all attachment hardware, as shown on Drawings, shall be supplied with the gates. These shall allow access to hydraulic cylinders and have adequate clearances to allow access below the gate for a 6-inch diameter hose for removal of sediment/debris. All plates and hardware shall be flush to the surrounding gate and shall be smooth with no sharp edges.

2.11 HINGES

A. The hinges shall be reinforced elastomeric type. Hinges and attachment hardware shall be flush or slightly recessed below the concrete foundation upstream of the hinge.

2.12 INSTRUMENTATION AND CONTROL

A. General: The Gate Control System shall be in accordance with Section 40 99 90, Package Control Systems, including, but not limited to, instruments, panels, control equipment, application software, control logic, and control system testing.

1. Hydraulic System Control Panel.
2.13 TESTING RECORDS

A. Submit written certificate attesting to product compliance with physical material requirements of this Section prior to installation of the gates and any related equipment.

PART 3 EXECUTION

3.01 PIPING, FOUNDATION SLAB AND WALL GENERAL REQUIREMENTS

A. The Installation Contractor shall store, protect, and install all manufacturer provided components listed in Part 2 of this Section.

B. The Installation Contractor shall prepare the foundations for the gates, including all anchors, sleeves, and embedments. Provide anchor bolts of length to allow for 1-1/2 inches of grout under base plates and adequate anchorage into structural concrete. Other specifically detailed lengths either shown or specified will supersede this requirement. Provide sleeves of at least 1-1/2 times anchor bolt diameter and of the same material as the anchor bolts. Anchor bolts shall be stainless steel Type 316 which conforms to ASTM A193.

C. The Installation Contractor shall furnish and install all auxiliary components necessary to make a complete and operational Gate. Never seize, or other approved lubricating compound, shall be used for all stainless steel anchor bolts and fasteners, 100 percent polyurethane caulk for all inter panel seals, and condensate piping.

D. The reinforcing steel and embeds will be placed in the foundation slab, with careful placement to achieve pull out capacity requirements of anchors as specified by the gate system supplier and structural engineering requirements. Care will be taken such that complete concrete penetration under and around embeds is achieved.

E. A steel trowel finish will be used on the base slabs below and downstream of the gates. Any rough points, edges or other defects will be ground smooth and as directed.

F. The foundation walls will be placed with a tolerance of plus or minus 1/8-inch of the designated vertical plane, with no edges, form ridges or other defects.

G. Embedment plates (or UHMW Abutment/Skids plates) or other provisions to provide a uniform and low-friction surface may be required at the foundation walls adjacent to the moveable panels of the WaveShapers. These surfaces will be in contact with the Reinforced Rubber Spacer (see below).
H. Reinforced Rubber Spacer (or J Bulbs) shall be provided to fill the gap between all WaveShaper panels and the concrete foundation walls. The design and detailing of this Reinforced Rubber Spacer shall prevent the formation of gaps during operations and shall provide for the longest practical life without maintenance. Smallest practical gaps and rubber spacers shall be used.

I. All embeds will be cleaned, threads cleaned, and bolts temporarily placed to determine that threads are clean and in good condition. Torque test pull-out resistance as directed.

J. Hydraulic piping shall be run in conduit, in covered raceways, or embedded in concrete as shown on Drawings. Conduits shall have long-radius bends and pull boxes at bends to facilitate pulling hydraulic piping lines through the conduit. Outside of conduits all lines shall be securely fastened with stainless steel connectors to prevent vibration and to uniformly support the hydraulic piping. Connectors from the hydraulic piping to the hoses shall be mounted with stainless steel bulkheads and bulkhead fittings so as to prevent movement of the hydraulic piping. Bulkheads shall be at least 4-inch square and 1/4-inch-thick.

3.02 INSTALLATION

A. General Requirements:

1. Installation Plan and Facilities: The Installation Contractor will develop an installation plan describing site storage and work areas, equipment needs, and other details in consultation with the Gate System Supplier, so that the gates and controls can be properly installed, tested, and operated.

2. Installation: The gates will be installed to achieve the requirements of the plans and specifications, and as directed by the Gate System Supplier. All materials and surfaces will be protected against damage. The sequence of construction will be as directed by the Gate System Supplier's technical advisor and to achieve the gate operational characteristics.

3. Testing: The equipment, bladders, panels, hinges, and controls will be tested in advance and during initial operation. Thereafter, any defects repaired as directed.

B. Gate System Supplier’s Technical Advisor and Engineer’s Representative:

1. General: The Gate System Supplier shall provide a factory-trained technical advisor to oversee installation of the gates, startup and testing of the operating equipment, and to instruct operating personnel. A representative of the Engineer will attend all meetings and installations as may be designated.
2. Pre-installation Meeting: A pre-installation meeting to be attended by the Gate System Supplier's technical advisor, Client, Engineer, and Installation Contractor personnel will be held within 2 weeks prior to the scheduled installation of any gate or gate component. The technical advisor shall provide the attendees with information regarding the proper procedures for installing the gates and related equipment.

3. Pre-installation Inspection: The Gate System Supplier's technical advisor and Engineer shall inspect the concrete foundation with anchoring system hardware and reinforcing steel prior to placement of concrete. The Engineer and manufacture shall receive 10 days advance notice of the scheduled concrete placement.

4. The installation of the hydraulic cylinders and gate panels, including preparatory work, shall be done with the Gate System Supplier’s technical advisor at the site. The Engineer and the Gate System Supplier will receive 10 days advance notice of scheduled installation. The technical advisor shall notify the Engineer as soon as possible of any discrepancies discovered in the work which may hinder successful installation of the gates.

5. Final Testing: The installed systems shall be leak tested, as specified elsewhere, for leakage by the Installation Contractor with the assistance of the gate manufacturer's technical advisor.

6. Final Inspection: A final inspection of the gate installation and related equipment will be performed by the Engineer with the assistance of the Gate System Supplier's technical advisor in conjunction with the final testing.

C. Testing:

1. General:
   a. The Installation Contractor shall be responsible for conducting testing of the installed system. Tests shall be conducted in the presence of the Engineer and the Gate System Supplier's technical advisor.
   b. All hydraulic lines shall be tested and accepted before installation of the gates commences.
   c. Hydraulic lines and hoses shall be tested by pressurizing to 3,000 psi. Pressure readings and ambient air temperature shall be recorded at six different times during each test. Any joints or fittings exhibiting leakage during this time shall be repaired or replaced.
   d. After installation of the system the gates shall be fully raised and lowered three times. The gates shall operate smoothly with no binding. WaveShaper gates shall be tested an additional three times, each time varying the position of each lip throughout the range of operation.
e. After installation of the gates with hydraulic cylinders, the hydraulic system shall be isolated from the pump system and held at a pressure of 3,000 psi for 24 hours. All hydraulic lines and hoses shall have no drop in pressure over a 24-hour period.

2. Reporting: The Gate System Supplier’s technical advisor shall prepare a written report of all tests. The report shall be attached to an Installation Acceptance which shall be submitted within 2 weeks of the end of the testing period.

3. Adjustments: During the Starting of Systems (Tuning) Phase, the gates shall be adjusted and tested as Directed by Engineer to verify a fully functioning system in the active flow condition.

4. Warranty: A written warranty with terms and conditions specified herein shall be submitted within 2 weeks following the final inspection. All equipment shall be warranted to be free from defects for a minimum period of 5 years from the date of final acceptance of the Work of this Contract.

END OF SECTION
SECTION 35 31 19.16
CONCRETE MASONRY UNIT REVETMENTS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, and Division 01, General Requirements Specification Sections, apply to this Section.

1.02 WORK OF THIS SECTION

A. Work of this Section includes furnishing all labor, materials, equipment, and incidentals required and performing all operations in connection with the installation of commercially available Articulating Concrete Blocks (ACB) for revetments and ramps in accordance with the lines, grades, design and dimensions shown on Drawings and as specified herein.

B. In addition to the work indicated, work includes restoring all areas within the limit of work disturbed by work of the Contract and coordination of work with other subcontractors.

1.03 RELATED SECTIONS

A. The following items of related work are specified and included in other Sections of the Specifications:

1. Section 01 33 00, Submittal Procedures.
2. Section 01 50 00, Temporary Facilities and Controls.
3. Section 31 23 16, Excavation.
4. Section 31 23 23, Fill and Backfill.
5. Section 31 32 19.16, Geotextile.
6. Section 31 37 00, Riprap.
7. Section 32 84 00, Landscape Irrigation.
8. Section 32 91 13.19, Planting Soil System Procurement.
10. Section 32 92 01, Prairies, Meadows, and Wetlands.
1.04 DEFINITIONS

A. Precast Articulating Concrete Block System: A matrix of interconnected concrete block units for erosion protection. Units are connected by geometric interlock and/or cables, geotextiles, or geogrids, and include a geotextile underlayment for subsoil retention.

B. Blocks: ACB revetment units will be referred to as blocks.

C. Interlocking Blocks: Each pair of abutting blocks shall have interlocking keys that limit lateral expansion. The key and keyhole shall have an interference fit such that the joint movement has a minimum aperture at closure, and a maximum aperture when pulled apart. The joint “freeplay” shall allow articulation of each individual block.

D. Freeplay: The maximum lateral joint movement for interlocking blocks (difference between maximum and minimum aperture).

1.05 PERFORMANCE REQUIREMENTS

A. Certification (Open-Channel Flow): ACB mats will only be accepted when accompanied by documented hydraulic performance characteristics that are derived from tests under controlled flow conditions. Testing guidelines shall conform to FHWA-RD-89-199 and all hydraulic performance testing shall be performed in a on a 2H:1V soil slope in a flume.

B. Static Coefficient of Friction for Paving: Value for Level Surfaces shall be 0.6 minimum in accordance with ASTM C1028.

1.06 SUBMITTALS

A. General: Refer to and comply with Section 01 33 00, Submittal Procedures, for procedures and additional submittal criteria.

B. Product Data: Submit descriptive technical data including all material properties specified herein. Include catalogue cuts, technical data sheets, or test data showing that the products meet the specifications. The submittal shall also include a copy of any standard manufacturer's warranties for the products.

1. Submit for:
   a. Articulating concrete block.
   b. Geotextile.
C. Samples:

1. Articulating Concrete Block: Submit one sample of each type of proposed block concurrent with the ACB and Geotextile Data product data submittal. The samples shall be typical of the size, texture, color, and finish.

D. Quality Control Submittals:

1. Test reports.
2. Geotextile Fabric: Submit manufacturer's certified test results showing actual test values obtained when the physical properties are tested for compliance with the requirements listed in Section 31 32 19.16, Geotextile. Include Gradient Ratio or the Hydraulic Conductivity Ratio tests as required for the geotextile selection in paragraph 2.3A.3.
3. Manufacturer's Certificates of Compliance: Submit for ACB blocks/mats, revetment cable, and any revetment cable fittings and connectors.

1.07 REFERENCES AND STANDARDS

A. The publications listed below form a part of this Specification to the extent referenced. The publications are referred to in the text by the basic designation only.

2. ASTM International (ASTM):
   b. C140, Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units.
   f. C618, Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete.
   g. C1262, Standard Test Method for Evaluating the Freeze-Thaw Durability of Manufactured Concrete Masonry Units and Related Concrete Units.
   h. D4873, Identification, Storage, and Handling of Geosynthetic Rolls and Samples.

   a. FHWA-RD, Minimizing Embankment Damage during Overtopping.

1.08 DELIVERY, STORAGE AND HANDLING

A. Acceptance at Site: Check products upon delivery to ensure that the proper material has been received and is undamaged. For geosynthetics, the guidelines presented in ASTM D4873 shall be followed.

B. Blocks: Store blocks in a suitable location away from mud, paint, wet cement, and other contamination or disturbance.

C. Geotextiles:
   1. Labeling: Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.
   2. Handling: Handle geosynthetic and unload by hand, or with load carrying straps, a forklift with a stinger bar, or an axial bar assembly. Do not drag geosynthetic rolls, lift by one end, lift by cables or chains, or drop to the ground.
   3. Storage: Protect geotextiles from cement, paint, excessive mud, chemicals, sparks and flames, temperatures in excess of 140 degrees F, and any other environmental condition that may degrade the physical properties. If stored outdoors, the rolls shall be elevated from the ground surface and protected with an opaque waterproof cover. Deliver geotextiles to the site in a dry and undamaged condition. To the extent possible, keep the fabric wrapped in its protective covering. Do not expose geotextile to sunlight, ultraviolet rays until the installation process begins.

1.09 SCHEDULING

A. To limit ultraviolet light exposure of the geotextile, place the ACB blocks within 7 days after placing the geotextile, and the void filler within 14 days after placing the geotextile.
PART 2 PRODUCTS

2.01 MATERIALS

A. Cementitious Materials:

1. Portland Cement: ASTM C150, Type II.
4. Pozzolans (Fly Ash and Raw or Calcined Natural Pozzolans for use in Portland Cement Concrete): ASTM C618.

B. Aggregates: Normal weight, ASTM C33, except that grading requirements shall not necessarily apply.

2.02 ARTICULATING CONCRETE BLOCK (ACB)

A. General:

1. Fabricate ACB mats as an assembly of concrete blocks, with specific hydraulic capacities, laced with revetment cables where indicated or required. ACB mats may be assembled on-site by hand-placing the individual units either with or without subsequent insertion of cables as indicated or noted on Drawings.

2. Individual units in the system shall be staggered and interlocked for enhanced stability. Construct the mats with open and/or closed cell units as indicated. The open cell units have two vertical openings of rectangular cross section with sufficient wall thickness to withstand loads applied during shipping and installation. Parallel strands of cable shall extend through two cable ducts in each block allowing for longitudinal binding of the units within a mat. Each row of units shall be laterally offset by one-half of a block width from the adjacent row so that any given block is cabled to four other blocks (two in the row above and two in the row below).

3. Each block shall incorporate interlocking surfaces that minimize lateral displacement of the blocks within the mats when they are lifted by the longitudinal revetment cables. The interlocking surfaces must not protrude beyond the perimeter of the blocks to such an extent that they reduce the flexibility or articulation capability of the cellular mats or become damaged or broken when the mats are lifted during shipment or placement. Once the mats are in place, the interlocking surfaces shall minimize the lateral displacement of the blocks even if the cables should become damaged or removed. The mats must be able to flex a minimum of 18 degrees between any given row or column of blocks in the uplift direction and a minimum of 45 degrees in the downward direction.
4. The cables inserted into the mats shall form lifting loops at one end of the mat with the corresponding cable ends spliced together to form a lifting loop at the other end of the mat. Insert the cables only after sufficient time has been allowed for the concrete to complete the curing process.

5. The cellular concrete mats shall be placed on a filter fabric as specified herein. Under no circumstances shall the geotextile be affixed (i.e., chemically bonded to the blocks) to the mattress in a manner in which would jeopardize the functionality of the filter fabric. Specifically, the filter fabric shall be independent of the block system.

B. Concrete Unit Requirements:

1. Blocks:
   a. ASTM D6684, sound and free of defects that would interfere with proper placement or that would impair the strength or longevity of the installation. Minor surface cracks, incidental to the usual method of manufacture, or chipping that result from customary methods of handling in shipping, delivery and placement will not be deemed grounds for rejection. Discard blocks with the following defects:
      1) Broken appendages.
      2) Chips larger than 2 inches in any dimension or resulting in a weight loss exceeding 10 percent of the average weight of a concrete unit.
      3) Cracks wider than 0.02 inch in width, longer than 33 percent of the nominal height, and/or 1.0 inch in depth.

2. The concrete units shall be produced by a dry cast method. The dry cast units obtain strength in a shorter duration as well as an increase in the durability and overall quality of product.

3. The minimum compressive strength shall be 4,000 psi for an average of three units, and 3,500 psi for an individual unit. Compressive strength shall be determined by ASTM C140.

4. The maximum water absorption for dry cast units shall be 9 pcf for an average of three units, and 12 pcf for an individual unit. Water absorption shall be determined by ASTM C140.

5. The minimum saturated surface-dry density shall be 140 for average of three units, and 140 for an individual unit.

6. For freeze-thaw durability tested in accordance with ASTM C1262, specimens shall comply with either of the following:
   a. The weight loss of each of five specimens after 100 cycles shall not exceed 1 percent; or
   b. The weight loss of each of five specimens after 150 cycles shall not exceed 1.5 percent.
C. The ACB Matrix Assembly shall meet the following criteria in Table 1 below:

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Required Value</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical Shear Stress, Minimum</td>
<td>3.5 psf</td>
<td>FHWA RD-89-199</td>
</tr>
<tr>
<td>Critical Velocity, Minimum</td>
<td>15 ft/sec</td>
<td>FHWA RD-89-199</td>
</tr>
<tr>
<td>Curvature Radius, Maximum</td>
<td>3 feet</td>
<td>Note b.</td>
</tr>
<tr>
<td>Surface Void Area Ratio</td>
<td>25 to 40 percent</td>
<td>Note c.</td>
</tr>
<tr>
<td>Drainage Correction Factor (dcf)</td>
<td>20 to 35 percent</td>
<td>Note d.</td>
</tr>
<tr>
<td>Block/Geotextile Interface Friction Angle</td>
<td>35 degrees</td>
<td>Note e.</td>
</tr>
</tbody>
</table>

Notes:

a. Determine the weight of the mattress per unit area with the nominal joint spacing, in a nonsubmerged condition.

b. The curvature radius shall be indicative of the ability of the assembled mattress to conform to one-dimensional subgrade curves without binding, such as for anchor trenches and swales. The curvature radius shall be demonstrated, if requested by the Construction Manager.

c. The surface void area ratio shall be determined at the visible (with filled voids) surface of the blocks, with the joints spaced in a neutral position (50%), and shall be expressed as a percentage of the gross mat area. The void area shall include area between the blocks and open cells within the block.

d. The drainage correction factor shall be the minimum void area ratio (usually taken at the base of the blocks), with the joints spaced in a neutral position (50% freeplay in each direction), and shall be expressed as a percentage of the gross mat area.

e. The concrete surface shall be sufficiently rough to prevent sliding of the blocks on the geotextile. The interface friction must be matched with the selected block and geotextile combination, and shall be included with the ACB and geotextile data submittal. The block/geotextile interface friction angle shall be demonstrated, if requested by the Landscape Architect.
D. Matrix Assembly - Interlocking Blocks: Interlocking blocks are assumed to function without the use of cables or similar restraints. Place void filler to inhibit lateral movement and block pullout, cover the geotextile, and increase hydraulic stability.

E. Matrix Assembly - Cabled Systems: Interlock cable tied concrete block by flexible cables running through the blocks. Each block shall be penetrated by a cable that allows articulation of the blocks, but restrains removal of individual blocks. Place void filler to inhibit lateral movement, cover the geotextile, and increase hydraulic stability.

F. Available Manufacturers:

4. “Or-equal.”

2.03 GEOTEXTILE

A. Geotextile used as filters below the ACB shall be a woven fabric. The geotextile shall meet the material properties specified in AASHTO M288 for Class 1 strength property requirements and for permanent erosion control. Filter requirements in AASHTO M288 shall be based on in-situ soil with greater than 50 percent passing the 0.075 mm sieve opening.

1. The geotextile must be permitted to function properly by allowing relief of hydrostatic pressure; therefore fine soil particles shall not be allowed to clog the fabric.

2. The geotextile fiber shall consist of a long-chain synthetic polymer composed of at least 85 percent by weight of propylene, ethylene, ester, or amide, and shall contain stabilizers and/or inhibitors added to the base plastic, if necessary, to make the filaments resistant to deterioration due to ultraviolet and heat exposure. The edges of the geotextile shall be finished to prevent the outer fiber from pulling away from the geotextile.
3. Final acceptance of the filtration geotextile by the Landscape Architect will be dependent upon the geotextile performance when tested in accordance with ASTM D5101. Soil characteristics such as grain size distribution and plasticity shall be determined for each source of borrow material used during construction. Significant differences in soil characteristics shall require further performance testing by either the Gradient Ratio or the Hydraulic Conductivity Ratio tests of ASTM D5101 at the discretion of the Landscape Architect. The locations for which the material to be tested is extracted shall be approved by the Landscape Architect. The Contractor shall provide the site-specific soil and modified Proctor curves for the site-soil, at their own expense, to the manufacturer. Also, the Contractor shall be responsible for the performance of the test by a certified independent laboratory experienced in performing such test. The test shall be performed under the actual field soil conditions or as otherwise required by the Landscape Architect.

4. In the event pre-assembled panels of fabric are required, the panels of geotextile fabric shall be sewn together at the manufacturer or another approved location.

2.04 CABLE

A. Installation Requirements for Cable: Size and fasten cable used for preassembled mattresses sufficient for the size/weight of the assembled mattresses such that the assembled mattresses can be placed in compliance with OSHA standards. The manufacturer shall be responsible for determining the minimum cable strength compatible with the mattress size for safe handling. Base cable strength on a minimum factor of safety of five, and include appropriate reduction factors for mechanically crimped cable, and other fasteners. If applicable, loading conditions shall include the use of a spreader bar for placing the mattresses.

B. Design Requirements for Cable: Use ropes manufactured from polyester, stainless steel wire, or galvanized steel wire for ACB's that rely on cables to maintain block to block interconnection. Select cable and fittings in a manner that ensures a safe design factor for mats being lifted from both ends, thereby forming a catenary. Consider the bending of the cables around hooks or pins during lifting. Select revetment cable splicing fittings so that the resultant splice provides a minimum of 60 percent of the minimum rated cable strength. Fittings such as sleeves and stops shall be aluminum and washers shall be galvanized steel unless otherwise shown on Drawings. The revetment cable shall exhibit resistance to most concentrated acids, alkalis and solvents. Cable shall be impervious to rot, mildew and degradation associated with marine
organisms. The materials used in the construction of the cable shall not be affected by continuous immersion in fresh or salt water.

1. Polyester Revetment Cable and Fittings:
   a. High tenacity, low elongating, continuous filament polyester fibers; and consisting of a core construction comprised of parallel fibers contained within an outer jacket or cover. The weight of the parallel core shall be between 65 percent to 70 percent of the total weight of the cable. The revetment cable shall have the following physical properties:

<table>
<thead>
<tr>
<th>Nominal Cable Dia. (D), inches</th>
<th>Approx. Avg. Strength (lbs)</th>
<th>Weight per Length (lbs/100 ft)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/4</td>
<td>3,000</td>
<td>2.2</td>
</tr>
<tr>
<td>5/16</td>
<td>7,000</td>
<td>4.4</td>
</tr>
<tr>
<td>3/8</td>
<td>10,000</td>
<td>5.5</td>
</tr>
<tr>
<td>1/2</td>
<td>15,000</td>
<td>9.7</td>
</tr>
</tbody>
</table>

1) Elongation requirements specified below are based upon stabilized new, dry cable. Stabilization refers to a process in which the cable is cycled 50 times between a load corresponding to 200D2 and a load equal to 10 percent, 20 percent or 30 percent of the cable's approximate average breaking strength. Relevant elongation values are as shown in Table 2 below. The tolerance on these values is plus 5 percent.

<table>
<thead>
<tr>
<th>Percentage of Break Strength</th>
<th>10%</th>
<th>20%</th>
<th>30%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Elongation</td>
<td>0.6</td>
<td>1.4</td>
<td>2.2</td>
</tr>
</tbody>
</table>
2. Galvanized Steel Revetment Cable and Fittings: Preformed galvanized aircraft cable made from individual wires and strands that have been formed during the manufacture into the shape they have in finished cable.
   a. Cable shall consist of a core construction comprised of seven wires wrapped within seven- or 19-wire strands with the physical properties in Table 3:

<table>
<thead>
<tr>
<th>Nominal Cable Dia. (D), inches</th>
<th>Type</th>
<th>Approx. Avg. Strength (lbs)</th>
<th>Weight per Length (lbs/100 ft)</th>

</tr>
</tbody>
</table>

2.05 VOID FILLER

A. Aggregate: Aggregate for filling the voids in the block shall meet the requirements of ASTM D1241, Gradation D.

2.06 FABRICATION

A. ACB, cables, and fittings may be fabricated into mattresses at the manufacturer's plant or another approved location into mats with a width of up to 8 feet and a length up to 40 feet, as approved by the Landscape Architect.

B. Mat Length: The ACB mats shall have the ability for fabrication in various lengths, widths, and in combinations of length and/or widths. Special mats are a combination of two opposing dimensions either in the longitudinal or transverse direction of the mats. The special mats are available in various dimensions that allow for a custom fit to a site-specific project.
2.07 SOURCE QUALITY CONTROL

A. The purchaser or their authorized representative shall be accorded proper access to facilities to inspect and sample the units at the place of manufacture from lots ready for delivery.

PART 3 EXECUTION

3.01 PREPARATION

A. Clearing: Completely remove all vegetation as specified in Section 31 10 00, Site Clearing. Remove remaining roots from trees and brush to a depth of 1 foot below the subgrade surface. Loose roots and twigs, turf clods, grade stakes, stones larger than 1/2-inch diameter, and other debris shall be raked and removed from the final surface. Rills and gullies from erosion shall be corrected.

B. General: Perform all subgrade preparation as per ASTM D6884. Place the ACB revetment on undisturbed native soils, or acceptably placed and compacted fill. Do not place the ACB on surfaces that contain mud, frost, organic soils, embankment that has not met compaction requirements, or where the Construction Manager determines that unsatisfactory material remains in or under the subgrade.

C. Bank Grading: Rough grade to a smooth surface, typical of that obtainable with a dozer and blade. A rough surface typically obtained with a backhoe or dragline will not be acceptable, except when ACB placement in water is shown on Drawings or approved by the Construction Manager. When natural shorelines require grading in preparation for ACB installation, observe and document the bank stratification in daily Contractor Quality Control reports. Avoid grading practices of spreading fine grained soils over more pervious soils, particularly near practices of spreading fine grained soils over more pervious soils, particularly near.
D. Compaction and Subgrade Finishing: Compact fill soils to the specified density in Section 31 23 23, Fill and Backfill. Compact incidental grading (where embankment is not otherwise specified) by heavy equipment or by tamping with a bucket to a density characteristic of the surrounding soils. Compact the final surfaces accessible by compaction equipment with a smooth drum roller or vibratory plate tamper until there is no further evidence of consolidation. Where slopes limit operation of compaction equipment, back-drag the final surface to a dense smooth surface with bladed equipment. Correct localized loose or soft zones.

1. Fine grade the slope to a smooth plane surface to ensure that intimate contact is achieved between the slope face and the geotextile (filter fabric), and between the geotextile and the entire bottom surface of the cellular concrete blocks. No holes, “pockmarks”, slope board teeth marks, footprints, or other voids greater than 0.5 inch in depth normal to the local slope face shall be permitted. No grooves or depressions greater than 0.5 inches in depth normal to the local slope face with a dimension exceeding 1 foot in any direction shall be permitted. Where such areas are evident, bring to grade by placing compacted homogeneous material. Uniformly compact the slope and slope face; the depth of layers, homogeneity of soil, and amount of compaction shall be as required by the Landscape Architect.

2. If and where indicated, excavate and prepare anchor trenches, flanking trenches, and toe trenches or aprons in accordance to the lines, grades and dimensions shown on Drawings. Uniformly grade the anchor trench hinge-point at the top of the slope so that no dips or bumps greater than 0.5 inch over or under the local grade occur. The width of the anchor trench hinge-point shall also be graded uniformly to assure intimate contact between all cellular concrete blocks and the underlying grade at the hinge-point.

3. Grade Tolerances: Within 2 inches from the prescribed elevations, with no abrupt variations that would cause unacceptable projections of individual blocks.

4. Subgrade Surface Tolerances: Maintained in a smooth condition between installation of the geotextile and the blocks. Windrows, stones, clods of cohesive soil, and irregularities shall be raked smooth. Correct ruts, rills and gullies resulting from traffic, precipitation runoff, groundwater seepage, etc., prior to installation of blocks.
3.02 GEOTEXTILE INSTALLATION

A. Inspection: Immediately prior to placing the fabric and ACB blocks, the prepared subgrade will be inspected by the Construction Manager and Landscape Architect. Do not place fabric or blocks thereon until that area has been approved by each of these parties.

1. At the time of installation, the geotextile will be rejected if it has been removed from its protective cover for over 72 hours or has defects, tears, punctures, flow deterioration, or damage incurred during manufacture, transportation or storage. With the acceptance of the Landscape Architect, place a geotextile fabric patch over the damaged area prior to placing the mats to repair a torn or punctured section of fabric. The patch shall be large enough to overlap a minimum of 3 feet in all directions.

B. General: Place geotextile within the limits of ACBs shown on Drawings and in accordance with as per ASTM D6884. Lay the geotextile flat and smooth so that it is in direct intimate contact with the subgrade. The geotextile shall be free of tension, folds, and wrinkles. Minimize the number of seams and overlaps by selective orientation of geotextile panels, within the limitations of maintaining a consistent pattern. Do not walk on or disturb the geotextile when the result is a loss of intimate contact between the cellular concrete block and the geotextile or between the geotextile and the subgrade. Place geotextile immediately prior to block installation, if necessary to limit damage to the geotextile from equipment or repeated pedestrian traffic and limit disturbance of the subgrade from precipitation or runoff.

C. Seams: Shingle seams on slopes and butt end seams so that runoff and channel flow passes over the fabric. Overlap the longitudinal and transverse joints at least 2 feet. Extend the geotextile at least 1 foot beyond the top and bottom revetment termination points, or as indicated or required by the Landscape Architect. If ACBs are assembled and placed as large mattresses, the top lap edge of the geotextile should not occur in the same location as a space between cellular concrete mats unless the space is concrete filled. Secure geotextile panels before block placement by adequate sandbags, spare blocks, or pins/staples.

3.03 ACB INSTALLATION

A. Place ACB in accordance with as per ASTM D6884, the manufacturer's recommendations and approved Shop Drawings.
B. Placement of Pre-Assembled Mattresses: Place with mattresses attached to a spreader bar or other approved device to aid in lifting, aligning and placing the mattresses by the use of a crane or other approved equipment. The equipment used shall have adequate capacity to place the mats without bumping, dragging, tearing or otherwise damaging the underlying fabric. Place the mattresses directly into position, side-by-side and/or end-to-end, so that the mats abut each other with a maximum space or gap between mattresses of 3 inches in excess of the nominal joint spacing of blocks within the mattress. Backfill mat seams or openings between mats greater than 2 inches with 4,000 psi nonshrink grout, concrete or other material approved by the Landscape Architect. Lift and reset mattresses out of alignment. Do not push or pull mattresses laterally after they are in contact with the geotextile. No overlapping of mats will be accepted and no blocks shall project vertically more than 1 inch beyond the adjacent blocks. As adjacent mats are placed, secure them to each other by fastening the protruding horizontal and vertical cable connections and end cable loops together along each side of the mats.

C. Whether placed by hand or in large mattresses, distinct changes in grade that results in a discontinuous revetment surface in the direction of flow will require backfill at the grade change location so as to produce a continuous surface.

D. Hand Placement of Interlocking Blocks: Space hand placed blocks to maximize the ACB ability to articulate. Use adequate alignment control, such as string lines, to keep the block pattern in alignment and the joint spacing consistent and uniform. Initially, no more than two working block rows shall progress simultaneously in the direction of placement. Add additional working rows only after experience shows that true lines are maintained. The starting position for ACB placement shall be a convenient location for control of the block pattern alignment. The Construction Manager shall approve of the starting position for placement of the ACB.

1. Target Joint Spacing: install interlocking blocks with a uniform aperture in the interlocking connections. The target joint spacing shall be neutrally spaced with equal free-play for the joint to open and close.
2. Correction of Joint Spacing: If the block pattern becomes skewed to an extent that blocks bind, joints close, or blocks stickup, then remove and replace ACB determined to be out of tolerance. Where the nonconformance of the joint spacing is due to project features, such as warped slopes or anchor trenches, then field locate cast-in-place concrete joints in concurrence with the Landscape Architect.
3. **Maintenance of Joint Spacing:** If the block pattern becomes skewed to an extent that the joint freeplay is not acceptable to the Landscape Architect, then cast-in-place concrete joints field located as directed by the Landscape Architect.

4. **Block Layout Pattern Dependent on Project Features:** If the block pattern is shown to be maintained parallel and perpendicular to selected project features, such as the crest/toe of levee/channel slopes, then implement field location of cast-in-place concrete joints as needed, and as directed by the Landscape Architect.

E. **Tolerances:** Maximum acceptable block projections (vertical offset from adjacent blocks) for “installation in the dry” shall not exceed 0.5 inch for interlocking blocks and 1 inch for cabled systems. Typical block projections shall be less than half the maximum projections.

F. **Termination trenches and side trenches** will be backfilled and compacted flush with the top of the blocks. The integrity of the trench backfill must be maintained so as to ensure a surface that is flush with the top surface of the cellular concrete blocks for its entire service life. Toe trenches will be backfilled as shown on Drawings.

G. **Finishing:** Backfill and compact the cells or openings in the cellular concrete blocks with suitable material, as specified by the Landscape Architect. Complete backfilling and compaction in a timely manner.

H. **Finishing requirements** are explicitly at the discretion of the Landscape Architect.

3.04 **CONCRETE JOINTS**

A. **General Requirements:**

1. Minimize the use of cast-in-place concrete joints to the extent practicable. Inform the Construction Manager of all concrete joints not shown on Shop Drawings prior to field placement. Joints that shall require concrete include:
   a. Joints between cable-tied ACB mattresses where the joint is 3 inches wider than the nominal joint.
   b. Joints where block interlock is discontinuous.
   c. Abutments where the ACB meets headwalls, pipe penetrations, or sidewalks.
   d. Any areas where there are partial blocks (to avoid small blocks with reduced hydraulic stability).
B. Abutments: The ACB shall abut pathways in a neat appearance. Unless a specific detail is indicated on Drawings, fill voids with partial blocks and fill the gap with cast-in-place concrete. Install the concrete flush with the surface of the blocks, and float finished.

3.05 VOID FILLER

A. The voids of the articulating concrete block mats shall be filled with aggregate void filler. All cable ties shall be completed prior to filling voids.

3.06 FIELD QUALITY CONTROL

A. Field installation procedures shall comply with the procedures utilized during the hydraulic testing procedures of the recommended system. All system restraints and ancillary components (such as synthetic drainage mediums) shall be employed as they were during testing. For example, if the hydraulic testing installations utilize a drainage layer then the field installation must utilize a drainage layer; an installation without the drainage layer would not be permitted.

B. Tests: The Contractor’s Testing Laboratory shall perform the following testing independent of the manufacturing process, by an agency other than the manufacturer. The ACB blocks shall be sampled and tested for compressive strength, water absorption and unit weight. The sample frequency shall be three specimens for each type of ACB.

1. Test methods shall be consistent with those specified in Part 2 of this section.

C. Manufacturer’s Field Service: The manufacturer of the ACB shall provide design and construction advice during the design and initial installation phases of the project as necessary, by the discretion of the Construction Manager.

3.07 PROTECTION

A. Protect work against damage from subsequent operations. Remove and replace displaced or broken blocks to conform to all requirements of this section. Do not incorporate damaged material into the work. Do not allow equipment on the ACB that could crack, cause abrasion, or otherwise damage the blocks. Do not operate vehicles directly on geotextile, except that rubber tired vehicles may operate directly on short reaches of geotextile that meets or exceeds AASHTO M288 survivability requirements for Class 1 geotextile, if there is no rutting, if the vehicle access is necessary to accomplish the work, and if the Construction Manager observes the operation and approves. Do not operate vehicles on the ACB until (during or after) placement of void filler.
Restrict vehicle traffic on the ACB to light weight rubber tired vehicles, and where intermittent access is necessary to accomplish the work. Routine haul routes will not be allowed. These allowances shall not waive the Contractor's obligation to maintain shall not waive the Contractor's obligation to maintain.

END OF SECTION

   b. International Mechanical Code (IMC).
5. Manufacturers’ Standardization Society (MSS):
   a. SP 58, Pipe Hangers and Supports—Materials, Design and Manufacture.
   b. SP 127, Bracing for Piping Systems Seismic-Wind-Dynamic Design, Selection, and Application.

1.02 DEFINITIONS

A. Wetted or Submerged: Submerged, less than 3 foot above liquid surface, below top of channel wall, under cover or slab of channel or tank, or in other damp locations.

1.03 SUBMITTALS

A. Action Submittals:

1. Catalog information and drawings of piping support system, locating each support, sway brace, seismic brace, hanger, guide, component, and anchor for piping 4 inches and smaller. Identify support, hanger, guide, and anchor type by catalog number and Shop Drawing detail number.
2. Calculations for each type of pipe support, attachment and anchor.
3. Revisions to support systems resulting from changes in related piping system layout or addition of flexible joints.
4. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:
   1. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
   2. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection, Observation, and Testing.
   3. Maintenance information on piping support system.

1.04 QUALIFICATIONS
   A. Piping support systems shall be designed and Shop Drawings prepared and sealed by a registered professional engineer in the state where the Work is to be installed.

1.05 DESIGN REQUIREMENTS
   A. General:
      1. Design, size, and locate piping support systems throughout facility, whether shown or not.
      2. Supports are shown only where specific types and locations are required; additional pipe supports may be required.
      3. Meet requirements of MSS SP 58 and ASME B31.1 or as modified by this section.
   B. Pipe Support Systems:
      1. Design pipe support systems for gravity and thrust loads imposed by weight of pipes or internal pressures, including insulation and weight of fluid in pipes.
      2. Seismic loads in accordance with governing codes.
      3. Maximum Support Spacing and Minimum Rod Size: In accordance MSS SP 58 Table 3 and Table 4.
      4. Electrical Conduit Support: Include in design of framing support system.
C. Anchoring Devices: Design, size, and space support anchoring devices, including anchor bolts, inserts, and other devices used to anchor support, to withstand shear and pullout loads imposed by loading and spacing on each particular support.

D. Vertical Sway Bracing: 10-foot maximum centers or as shown.

PART 2 PRODUCTS

2.01 GENERAL

A. When specified items are not available, fabricate pipe supports of correct material and to general configuration indicated.

B. Special support and hanger details may be required for cases where standard catalog supports are not applicable.

C. Materials: In accordance with Table 1, attached as Supplement at end of section.

2.02 HANGERS

A. Clevis: MSS SP 58, Type 1:

1. Anvil; Figure 260 for steel pipe and Figure 590 for ductile-iron pipe, sizes 1/2 inch through 30 inches.
2. Insulated Steel Pipe: Anvil; Figure 260 with insulated saddle system (ISS), sizes 1/2 inch through 16 inches.
3. B-Line; Figure B3100, sizes 1/2 inch through 30 inches.

B. Adjustable Swivel Split-Ring Pipe Clamp: MSS SP 58, Type 6:

1. Anvil; Figure 104, sizes 3/4 inch through 8 inches.
2. B-Line; Figure B3171, sizes 3/4 inch through 8 inches.

C. Steel Yoke Pipe Rolls and Roller Supports: MSS SP 58, Type 41 or Type 43:

1. Anvil; Figure 181 for sizes 2-1/2 inches through 24 inches, and Figure 171 for sizes 1 inch through 30 inches.
2. B-Line; Figure B3110 for sizes 2 inches through 24 inches and Figure B3114 for 30 inches.

D. Pipe Rollers and Supports: MSS SP 58, Type 44:

1. Anvil; Figure 175, sizes 2 inches through 30 inches.
2. B-Line; Figure B3120, sizes 2 inches through 24 inches.
2.03 WALL BRACKETS, SUPPORTS, AND GUIDES

A. Welded Steel Wall Bracket: MSS SP 58, Type 33 (heavy-duty):
   1. Anvil; Figure 199, 3,000-pound rating.
   2. B-Line; Figure B3067, 3,000-pound rating.

B. Adjustable “J” hanger MSS SP 58, Type 5:
   1. Anvil; Figure 67, sizes 1/2 inch through 8 inches.
   2. B-Line; Figure B3690, sizes 1/2 inch through 8 inches.

C. Offset Pipe Clamp: Anvil; Figure 103, sizes 3/4 inch through 8 inches.

D. Channel Type:
   1. Unistrut.
   2. Anvil; Power-Strut.
   3. B-Line; Strut System.
   4. Aickinstrut (FRP).

2.04 PIPE SADDLES

A. Saddle Supports, Pedestal Type:
   1. Minimum standard weight pipe stanchion, saddle, and anchoring flange.
   2. Nonadjustable Saddle: MSS SP 58, Type 37 with U-bolt.
      a. Anvil; Figure 259, sizes 4 inches through 36 inches with Figure 63C base.
      b. B-Line; Figure B3095, sizes 1 inch through 36 inches with B3088S base.
   3. Adjustable Saddle: MSS SP 58, Type 38 without clamp.
      a. Anvil; Figure 264, sizes 2-1/2 inches through 36 inches with Figure 62C base.
      b. B-Line; Figure B3092, sizes 3/4 inch through 36 inches with Figure B3088S base.

2.05 CHANNEL TYPE SUPPORT SYSTEMS

A. Channel Size: 12-gauge, 1-5/8-inch wide minimum steel, or 1-1/2-inch wide, minimum FRP.

B. Members and Connections: Design for loads using one-half of manufacturer’s allowable loads.
C. Fasteners: Vinyl ester fiber, polyurethane base composite nuts and bolts, or encapsulated steel fasteners.

D. Manufacturers and Products:
   1. B-Line; Strut System.
   2. Unistrut.
   3. Anvil; Power-Strut.
   4. Aickinstrut (FRP System).
   5. Enduro-Durostrut (FRP Systems).

2.06 PIPE CLAMPS

A. Riser Clamp: MSS SP 58, Type 8.
   1. Anvil; Figure 261, sizes 3/4 inch through 24 inches.
   2. B-Line; Figure B3373, sizes 1/2 inch through 30 inches.

2.07 ELBOW AND FLANGE SUPPORTS

A. Elbow with Adjustable Stanchion: Sizes 2 inches through 18 inches, Anvil; Figure 62C base.

B. Elbow with Nonadjustable Stanchion: Sizes 2-1/2 inches through 42 inches, Anvil; Figure 63A or Figure 63B base.

C. Flange Support with Adjustable Base: Sizes 2 inches through 24 inches, Standon; Model S89.

2.08 INTERMEDIATE PIPE GUIDES

A. Type: Hold down pipe guide.
   1. Manufacturer and Product: B-Line; Figure B3552, 1-1/2 inches through 30 inches.

B. Type: U-bolts with double nuts to provide nominal 1/8-inch to 1/4-inch clearance around pipe; MSS SP 58, Type 24.
   1. Anvil; Figure 137 and Figure 137S.
   2. B-Line; Figure B3188 and Figure B3188NS.
2.09 PIPE ALIGNMENT GUIDES

A. Type: Spider.

B. Manufacturers and Products:
   1. Anvil; Figure 255, sizes 1/2 inch through 24 inches.
   2. B-Line; Figure B3281 through Figure B3287, sizes 1/2 inch through 24 inches.

2.10 PIPE ANCHORS

A. Type: Anchor chair with U-bolt strap.

B. Manufacturer and Product: B-Line; Figure B3147A or Figure B3147B.

2.11 SEISMIC RESTRAINTS

A. Solid pipe bracing attachment to pipe clevis with clevis cross brace and angle rod reinforcement.

B. Manufacturers:
   1. Mason Industries.
   2. B-Line.
   3. Anvil.

2.12 ACCESSORIES

A. Anchor Bolts:
   1. Size and Material: Sized by Contractor for required loads, 1/2-inch minimum diameter, and as specified in Section 05 50 00, Metal Fabrications.
   2. Bolt Length (Extension Above Top of Nut):
      a. Minimum Length: Flush with top of nut preferred. If not flush, shall be no more than one thread recessed below top of nut.
      b. Maximum Length: No more than a full nut depth above top of nut.

B. Dielectric Barriers:
   1. Plastic coated hangers, isolation cushion, or tape.
   2. Manufacturer and Products:
      a. B-Line; B1999 Vibra Cushion.
      b. B-Line; Iso Pipe, Isolation Tape.
C. Insulation Shields:
   1. Type: Galvanized steel or stainless steel, MSS SP 58, Type 40.
   2. Manufacturers and Products:
      a. Anvil; Figure 167, sizes 1/2 inch through 24 inches.
      b. B-Line; Figure B3151, sizes 1/2 inch through 24 inches.

D. Welding Insulation Saddles:
   1. Type: MSS SP 58, Type 39.
   2. Manufacturers and Products:
      a. Anvil; Figure Series 160, sizes 1 inch through 36 inches.
      b. B-Line; Figure Series B3160, sizes 1/2 inch through 24 inches.

E. Hanger Rods, Clevises, Nuts, Sockets, and Turnbuckles: In accordance with MSS SP 58.

F. Attachments:
   1. I-Beam Clamp: Concentric loading type, MSS SP 58, Type 21, Type 28, Type 29, or Type 30, which engage both sides of flange.
   2. Concrete Insert: MSS SP 58, Type 18, continuous channel insert with load rating not less than that of hanger rod it supports.
   3. Welded Beam Attachment: MSS SP 58, Type 22.
      a. Anvil; Figure 66.
      b. B-Line; Figure B3083.
   4. U-Channel Concrete Inserts: As specified in Section 05 50 00, Metal Fabrications.
   5. Concrete Attachment Plates:
      a. Anvil; Figure 47, Figure 49, or Figure 52.
      b. B-Line; Figure B3084, Figure B3085, or Figure B3086.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Install support systems in accordance with MSS SP 58, unless shown otherwise.
   2. Install pipe hanger rods plumb, within 4 degrees of vertical during shut down, start up or operations.
   3. Support piping connections to equipment by pipe support and not by equipment.
4. Support large or heavy valves, fittings, and appurtenances independently of connected piping.
5. Support no pipe from pipe above it.
6. Support pipe at changes in direction or in elevation, adjacent to flexible joints and couplings, and where shown.
7. Do not use adhesive anchors for attachment of supports to ceiling or walls.
8. Do not install pipe supports and hangers in equipment access areas or bridge crane runs.
9. Brace hanging pipes against horizontal movement by both longitudinal and lateral sway bracing and to reduce movement after startup.
10. Install lateral supports for seismic loads at changes in direction.
11. Install pipe anchors where required to withstand expansion thrust loads and to direct and control thermal expansion.
12. Repair mounting surfaces to original condition after attachments are completed.

B. Standard Pipe Supports:

1. Horizontal Suspended Piping:
   a. Single Pipes: Clevis hangers or adjustable swivel split-ring.
   b. Grouped Pipes: Trapeze hanger system.
2. Horizontal Piping Supported from Walls:
   a. Single Pipes: Wall brackets, or attached to wall, or to wall mounted framing with anchors.
   b. Stacked Piping: Wall mounted framing system and “J” hangers acceptable for pipe smaller than 3-inch.
   c. Pipe clamp that resists axial movement of pipe through support is not acceptable. Use pipe rollers supported from wall bracket.
3. Horizontal Piping Supported from Floors:
   a. Saddle Supports:
      1) Pedestal Type, elbow and flange.
      2) Provide minimum 1-1/2-inch grout beneath baseplate.
   b. Floor Mounted Channel Supports:
      1) Use for pipe smaller than 3-inch running along floors and in trenches at pipe elevations lower than can be accommodated using pedestal pipe supports.
      2) Attach channel framing to floors with baseplate on minimum 1-1/2-inch nonshrink grout and with anchor bolts.
      3) Attach pipe to channel with clips or pipe clamps.
   c. Concrete Cradles: Use for pipe larger than 3 inches along floor and in trenches at pipe elevations lower than can be accommodated using stanchion type.
4. **Vertical Pipe**: Support with wall bracket and elbow support, or riser clamp on floor penetration.

C. **Intermediate and Pipe Alignment Guides**:

1. Provide pipe alignment guides, or pipe supports that provide same function, at expansion joints and loops.
2. Guide pipe on each side of expansion joint or loop at 4 pipe and 14 pipe diameters from each joint or loop.
3. Install intermediate guides on metal framing support systems not carrying pipe anchor or alignment guide.

D. **Accessories**:

1. **Dielectric Barrier**:
   a. Provide between painted or galvanized carbon steel members and copper or stainless steel pipe or between stainless steel supports and nonstainless steel ferrous metal piping.
   b. Install rubber wrap between submerged metal pipe and oversized clamps.

3.02 **FIELD FINISHING**

A. Paint atmospheric exposed surfaces hot-dip galvanized steel components as specified in Section 09 90 00, Painting and Coating.

3.03 **SUPPLEMENT**

A. The supplement listed below, following “End of Section,” is a part of this specification:

1. Table 1: Nonchemical Areas.

**END OF SECTION**
<table>
<thead>
<tr>
<th>Exposure Conditions</th>
<th>Support Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressor Building</td>
<td>Galvanized steel or precoated steel, plastic coated hangers for uninsulated stainless steel piping</td>
</tr>
<tr>
<td>Process Areas: Wetted or Submerged</td>
<td>Stainless steel or FRP</td>
</tr>
</tbody>
</table>

Notes:
1. Precoated steel to be fusion bonded epoxy or vinyl copolymer (Plastisol).
2. Stainless steel to be Type 316.
3. Galvanized steel to be per ASTM A653/A653M, Class G90, or hot-dip galvanized after fabrication to ASTM A123/A123M.
SECTION 40 27 00
PROCESS PIPING—GENERAL

PART 1   GENERAL

1.01 DEFINITIONS

   A. Submerged or Wetted: Zone below elevation of liquid surface or within 3 feet above top of liquid surface.

1.02 DESIGN REQUIREMENTS

   A. Where pipe diameter, thickness, pressure class, pressure rating, or thrust restraint is not shown or specified, design piping system in accordance with the following:

      2. Allowable Soil Pressure 1,000 pounds per square foot.
         a. Low Pressure Pipelines:
            1) When bearing surface of the fitting against soil provides an area equal to or greater than area required for thrust restraint, concrete thrust blocks will not be required.
            2) Determine bearing area for fittings without thrust blocks by projected area of 70 percent of internal diameter multiplied by chord length for fitting centerline curve.

1.03 SUBMITTALS

   A. Action Submittals: Anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

   B. Informational Submittals:

      1. Manufacturer’s Certification of Compliance, in accordance with Section 1 61 00, Common Product Requirements.
         a. Pipe and fittings.
      2. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
      3. Qualifications:
         b. AWS QC1 Certified Welding Inspector: Submit evidence of current certification prior to commencement of welding activities.
         c. Welders:
            1) Continuity log for welders and welding operators.
2) Welder qualification test records conducted by Contractor or manufacturer.

4. Welding Procedures: Qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX for weld type(s) and base metal(s).

5. Nondestructive inspection and testing procedures.

6. Test logs.

7. CWI inspection records and NDE test records.

### 1.04 QUALITY ASSURANCE

#### A. Qualifications:

1. Independent Inspection and Testing Agency:
   a. 10 years’ experience in field of welding and welded pipe and fittings’ testing required for this Project.
   b. Calibrated instruments and equipment, and documented standard procedures for performing specified testing.
   c. Certified in accordance with ASNT SNT-TC-1A for testing procedures required for this Project.
   d. Testing Agency: Personnel performing tests shall be NDT Level II certified in accordance with ASNT SNT-TC-1A.
   e. Verification Welding Inspector: AWS QC1 Certified.

2. Welding Procedures: In accordance with ASME BPVC SEC IX (Forms QW-482 and QW-483) or AWS D1.1/D1.1M (Annex N Forms).

3. Welder Qualifications: In accordance ASME BPVC SEC IX (Form QW-484) or AWS D1.1/D1.1M (Annex N Forms).

4. Contractor’s CWI: Certified in accordance with AWS QC1, and having prior experience with specified welding codes. Alternate welding inspector qualifications require approval by Engineer.

#### B. Quality Assurance: Provide services of independent inspection and testing agency for welding operations.

1. Note, the presence of Owner’s Special Inspector or Verification CWI does not relieve Contractor from performing own quality control, including 100 percent visual inspection of welds.

### 1.05 DELIVERY, STORAGE, AND HANDLING

#### A. In accordance with Section 01 61 00, Common Product Requirements, and:

1. Threaded or Socket Welding Ends: Fit with metal, wood, or plastic plugs or caps.

3. Cold Weather Storage: Locate products to prevent coating from freezing to ground.
4. Handling: Use heavy canvas or nylon slings as needed to lift pipe and fittings.

PART 2 PRODUCTS

2.01 PIPING
   A. As specified on Piping Data Sheet and Piping Schedule located at the end of this section as Supplements.
   B. Diameters Shown:

2.02 JOINTS
   A. Threaded Joints: NPT taper pipe threads in accordance with ASME B1.20.1.

2.03 GASKET LUBRICANT
   A. Lubricant shall be supplied by pipe manufacturer and no substitute or “or-equal” will be allowed.

PART 3 EXECUTION

3.01 EXAMINATION
   A. Verify size, material, joint types, elevation, horizontal location, and pipe service of existing pipelines to be connected to new pipelines or new equipment.
   B. Inspect size and location of structure penetrations to verify adequacy of wall pipes, sleeves, and other openings.

3.02 PREPARATION
   A. Notify Engineer at least 2 weeks prior to field fabrication of pipe or fittings.
   B. Inspect pipe and fittings before installation, clean ends thoroughly, and remove foreign matter and dirt from inside.

3.03 WELDING
   A. Perform in accordance with Section IX, ASME Boiler and Pressure Vessel Code and ASME B31.3 for Pressure Piping, as may be specified on Piping Data Sheets, and if recommended by piping or fitting manufacturer.
B. Weld Identification: Keep paper record of which welder welded each joint.

C. Pipe End Preparation:
   2. Oxygen or Arc Cutting: Smooth to touch, true, and slag removal by chipping or grinding.

D. Surfaces:
   1. Clean and free of paint, oil, rust, scale, slag, or other material detrimental to welding.
   2. Clean stainless steel joints with stainless steel wire brushes or stainless steel wool prior to welding.
   3. Thoroughly clean each layer of deposited weld metal, including final pass, prior to deposition of each additional layer of weld metal with a power-driven wire brush.

E. Alignment and Spacing:
   1. Align ends to be joined within existing commercial tolerances on diameters, wall thicknesses, and out-of-roundness.
   2. Root Opening of Joint: As stated in qualified welding procedure.
   3. Minimum Spacing of Circumferential Butt Welds: Minimum four times pipe wall thickness or 1 inch, whichever is greater.

F. Climatic Conditions: Do not perform welding if there is impingement of any rain, snow, sleet, or wind exceeding 5 mph on the weld area, or if ambient temperature is below 32 degrees F.

G. Tack Welds: Performed by qualified welder using same procedure as for completed weld, made with electrode similar or equivalent to electrode to be used for first weld pass, and not defective. Remove those not meeting requirements prior to commencing welding procedures.

H. Surface Defects: Chip or grind out those affecting soundness of weld.

I. Weld Quality: Meet requirements of governing welding codes.

3.04 INSTALLATION—GENERAL

A. Join pipe and fittings in accordance with manufacturer’s instructions, unless otherwise shown or specified.

B. Remove foreign objects prior to assembly and installation.
C. Threaded and Coupled Joints:
   2. Produce sufficient thread length to ensure full engagement when screwed home in fittings.
   3. Countersink pipe ends, ream and clean chips and burrs after threading.
   4. Make connections with not more than three threads exposed.
   5. Lubricate male threads only with thread lubricant or tape as specified on Piping Data Sheets.

D. Pipe Connections at Concrete Structures: As specified in Article Piping Flexibility Provisions in Section 40 27 01, Process Piping Specialties, and as shown on Drawings.

3.05 INSTALLATION—EXPOSED PIPING

A. Piping Runs:
   1. Parallel to building or column lines and perpendicular to floor, unless shown otherwise.
   2. Piping upstream and downstream of flow measuring devices shall provide straight lengths as required for accurate flow measurement.

B. Supports: As specified in Section 40 05 15, Piping Support Systems.

C. Group piping wherever practical at common elevations; install to conserve building space and not interfere with use of space and other work.

D. Unions or Flanges: Provide at each piping connection to equipment or instrumentation on equipment side of each block valve to facilitate installation and removal.

E. Install piping so that no load or movement in excess of that stipulated by equipment manufacturer will be imposed upon equipment connection; install to allow for contraction and expansion without stressing pipe, joints, or connected equipment.

F. Piping clearance, unless otherwise shown:
   1. Over Walkway and Stairs: Minimum of 7 feet 6 inches, measured from walking surface or stair tread to lowest extremity of piping system including flanges, valve bodies or mechanisms, insulation, or hanger/support systems.
2. Between Equipment or Equipment Piping and Adjacent Piping: Minimum 3 feet, measured from equipment extremity and extremity of piping system including flanges, valve bodies or mechanisms, insulation, or hanger/support systems.

3. From Adjacent Work: Minimum 1 inch from nearest extremity of completed piping system including flanges, valve bodies or mechanisms, insulation, or hanger/support systems.

4. Do not route piping in front of or to interfere with access ways, ladders, stairs, platforms, walkways, openings, doors, or windows.

5. Headroom in front of openings, doors, and windows shall not be less than the top of the opening.

6. Do not install piping containing liquids or liquid vapors in transformer vaults or electrical equipment rooms.

7. Do not route piping over, around, in front of, in back of, or below electrical equipment including controls, panels, switches, terminals, boxes, or other similar electrical work.

3.06 INSTALLATION—ENCEASED PIPE

A. As shown on Drawings.

3.07 SLAB, FLOOR, WALL, AND ROOF PENETRATIONS

A. Application and Installation: As specified in Section 40 27 01, Process Piping Specialties.

3.08 BRANCH CONNECTIONS

A. Do not install branch connections smaller than 1/2-inch nominal pipe size, including instrument connections, unless shown otherwise.

B. When line of lower pressure connects to a line of higher pressure, requirements of Piping Data Sheet for higher pressure rating prevails up to and including first block valve in the line carrying the lower pressure, unless otherwise shown.

3.09 VENTS AND DRAINS

A. Vents and drains at high and low points in piping required for completed system may or may not be shown. Install vents on high points and drains on low points of pipelines.

3.10 FIELD QUALITY CONTROL

A. Pressure Leakage Testing: As specified in Section 40 80 01, Process Piping Leakage Testing.
B. Minimum Duties of Welding Inspector:
   1. Job material verification and storage.
   2. Qualification of welders.
   3. Certify conformance with approved welding procedures.
   4. Maintenance of records and preparation of reports in a timely manner.
   5. Notification to Engineer of unsatisfactory weld performance within 24 hours of weld test failure.

C. Required Weld Examinations:
   1. Perform examinations in accordance with Piping Code ASME B31.3.
   2. Perform examinations for every pipe thickness and for each welding procedure, progressively, for piping covered by this section.
   3. Examine at least one of each type and position of weld made by each welder or welding operator.
   4. For each weld found to be defective under the acceptance standards or limitations on imperfections contained in the applicable Piping Code, examine two additional welds made by the same welder that produced the defective weld. Such additional examinations are in addition to the minimum required above. Examine, progressively, two additional welds for each tracer examination found to be unsatisfactory.

3.11 CLEANING
   A. Blow clean of loose debris process air lines with compressed air at 4,000 fpm; do not flush with water.
   B. Insert cone strainers in flushing connections to attached equipment and leave in-place until cleaning is complete.

3.12 SUPPLEMENTS
   A. The supplements listed below, following “End of Section,” are a part of this Specification:
      1. Piping Schedule.
      2. Data Sheet.

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Society of Mechanical Engineers (ASME):

2. American Water Works Association (AWWA):
   c. C210, Liquid-Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines.
   d. C213, Fusion-Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines.
   e. C219, Bolted, Sleeve-Type Couplings for Plain-End Pipe.

3. ASTM International (ASTM):

5. NSF International (NSF):
   a. NSF/ANSI 61, Drinking Water System Components - Health Effects.
   b. NSF/ANSI 372, Drinking Water System Components - Lead Content.

1.02 SUBMITTALS

A. Action Submittals: Manufacturer’s data on materials, construction, end connections, ratings, overall lengths, and live lengths (as applicable).

B. Informational Submittals: Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.
PART 2 PRODUCTS

2.01 GENERAL

A. Provide required piping specialty items, whether shown or not shown on Drawings, as required by applicable codes and standard industry practice.

B. Rubber ring joints, mechanical joints, flexible couplings, and proprietary restrained ductile iron pipe joints are considered flexible joints; welded, screwed, and flanged pipe joints are not considered flexible.

2.02 CONNECTORS

A. Flexible Metal Hose Connector:

1. Type: Close pitch, annular corrugated with single braided jacket.
3. End Connections:
   a. 3 Inches and Larger: Shop fabricated flanged ends to match mating flanges.
   b. 2-1/2 Inches and Smaller: Screwed ends with one union end.

   Minimum Burst Pressure: 3500 psig at 70 degrees F for 12 inches and smaller.
4. Length: Provide hose live-length equal to lengths shown on Gate Supplier Shop Drawings.
5. Manufacturers:
   a. U.S. Hose Corp.
   b. Anamet Industrial, Inc.

B. Flexible Hose Connector for AHP Service:

1. Pressure Rating: 150 psig.
2. Material: Suitable for air service
4. Manufacturers:
   a. U.S. Hose Corp.
   b. JGB Enterprises.

2.03 EXPANSION JOINTS

A. Flexible Metal Hose:

1. Type: Close pitch, annular corrugated with single braided jacket.
3. End Connections:
   a. 3 Inches and Larger: Shop fabricated flanged ends to match mating flanges.
b. 2-1/2 Inches and Smaller: Screwed ends with one union end.
4. Minimum Burst Pressure: 600 psig at 70 degrees F for 12 inches and smaller.
5. Length: Provide hose live-length equal to lengths shown on Drawings.
6. Manufacturers and Products:
   a. U.S. Hose Corp.; Series 401M.
   b. Anamet Industrial, Inc.; BWC21-1.

2.04 PIPE SLEEVES

A. Molded Polyethylene Pipe Sleeve:
   1. Molded HDPE with integral water stop ring not less than 3 inches larger than sleeve.
   2. Provided with end caps for support during concrete placement.
   3. Manufacturer and Product: Century-Line, Model CS sleeves as manufactured by PSI-Thunderline/Link-Seal.

B. Insulated and Encased Pipe Sleeve:
   1. Manufacturer and Product: Pipe Shields, Inc.; Models WFB, WFB-CS and -CW Series, as applicable.

C. Modular Mechanical Seal:
   1. Type: Interconnected synthetic rubber links shaped and sized to continuously fill annular space between pipe and wall sleeve opening.
   2. Fabrication:
      a. Assemble interconnected rubber links with ASTM A276, Type 316 stainless steel bolts and nuts.
      b. Pressure plates shall be reinforced nylon polymer.
   3. Size: According to manufacturer’s instructions for size of pipes shown to provide a watertight seal between pipe and wall sleeve opening.

2.05 SLAB, FLOOR, WALL AND ROOF PENETRATIONS

A. Steel or Stainless Steel Wall Pipe:
   1. Same material and thickness as connecting pipe, except 1/4-inch minimum thickness.
   2. Lining: Same as connecting pipe.
   3. Thrust Collar:
      a. Outside Diameter: Unless otherwise shown, 3 inches greater than outside diameter of wall pipe.
      b. Continuously fillet welded on each side all around.
2.06 HYDRAULIC FLUID HOSE

1. Pressure Rating: 3,000 psig.
2. Connectors: Stainless steel quick connects and fittings.
3. Hose and fittings shall be approved for Marine Applications (SAE J1942).
4. Manufacturer and Product: Global M3K Mega3000® Hose; SAE 100R17.

PART 3 EXECUTION

3.01 GENERAL

A. Provide accessibility to piping specialties for control and maintenance.

3.02 PIPING EXPANSION

A. Piping Installation: Allow for thermal expansion due to differences between installation and operating temperatures.

B. Expansion Joints:

2. Pipe Run Offset: Flexible metal hose.

C. Anchors: Install as specified in Section 40 05 15, Piping Support Systems, to withstand expansion joint thrust loads and to direct and control thermal expansion.

3.03 FLEXIBLE PIPE CONNECTIONS TO EQUIPMENT

A. Install to prevent piping from being supported by equipment, for vibration isolation, and where shown.

B. Product Applications Unless Shown Otherwise:

2. Compressor Discharge: Flexible metal hose connector provided with compressor.

3.04 PIPE SLEEVES

A. Application:

1. As specified in Section 40 27 00, Process Piping—General.
3. Belowgrade or in Submerged or Damp Environments: Shop-lined and coated.
4. Alternatively, molded polyethylene pipe sleeve as specified may be applied.

B. Installation:
   1. Support noninsulating type securely in formwork to prevent contact with reinforcing steel and tie-wires.
   2. Caulk joint with specified sealant in non-submerged applications and seal below grade and submerged applications with wall penetration seal.

3.05 SLAB, FLOOR, WALL AND ROOF PENETRATIONS

A. Applications:
   1. Watertight and Below Ground Penetrations:
      a. Wall pipes with thrust collars.
      b. Provide taps for stud bolts in flanges to be set flush with wall face.
   3. Existing Walls: Rotary drilled holes.
   4. Fire-Rated or Smoke-Rated Walls, Floors or Ceilings: Insulated and encased pipe sleeves.

B. Wall Pipe Installation:
   1. Isolate embedded metallic piping from concrete reinforcement.
   2. Support wall pipes securely by formwork to prevent contact with reinforcing steel and tie-wires.

END OF SECTION
PART 1    GENERAL

1.01 SUBMITTALS

A. Informational Submittals:

1. Testing Plan:
   a. Submit prior to testing and include at least the information that follows.
      1) Testing dates.
      2) Piping systems and section(s) to be tested.
      3) Test type.
      4) Method of isolation.
      5) Calculation of maximum allowable leakage for piping section(s) to be tested.

PART 2    PRODUCTS (NOT USED)

PART 3    EXECUTION

3.01 PREPARATION

A. Notify Engineer in writing 5 days in advance of testing. Perform testing in presence of Engineer.

B. Pressure Piping:

1. Install temporary thrust blocking or other restraint as necessary to protect adjacent piping or equipment and make taps in piping prior to testing.
2. Prior to test, remove or suitably isolate appurtenant instruments or devices that could be damaged by pressure testing.
3. New Piping Connected to Existing Piping: Isolate new piping with grooved-end pipe caps, spectacle blinds, blind flanges, or as acceptable to Engineer.
4. Test Pressure: As indicated on Piping Schedule in Section 40 27 00, Process Piping—General.
3.02 HYDROSTATIC TEST FOR PRESSURE PIPING

A. Fluid: Clean river water, potable water, or hydraulic fluid as indicated on Piping Schedule.

B. Exposed Piping:
   1. Perform testing on installed piping prior to application of insulation.
   2. Maximum Filling Velocity: 0.25 foot per second, applied over full area of pipe.
   3. Vent piping during filling. Open vents at high points of piping system or loosen flanges, using at least four bolts, or use equipment vents to purge air pockets.
   4. Maintain hydrostatic test pressure continuously for 60 minutes, minimum, and for such additional time as necessary to conduct examinations for leakage.
   5. Examine joints and connections for leakage.
   6. Correct visible leakage and retest as specified.

C. Buried Piping:
   1. Test after backfilling has been completed.
   2. Expel air from piping system during filling.
   3. Apply and maintain specified test pressure with hydraulic force pump. Valve off piping system when test pressure is reached.
   4. Maintain hydrostatic test pressure continuously for 2 hours minimum, reopening isolation valve only as necessary to restore test pressure.
   5. Determine actual leakage by measuring quantity of water necessary to maintain specified test pressure for duration of test.
   6. No leakage allowed.
   7. Correct leakage greater than allowable, and retest as specified.

3.03 PNEUMATIC TEST FOR PRESSURE PIPING

A. Do not perform on:
   1. PVC or CPVC pipe.
   2. Piping larger than 18 inches.
   3. Buried and other non-exposed piping.

B. Fluid: Oil-free, dry air.
C. Procedure:

1. Apply preliminary pneumatic test pressure of 25 psig maximum to piping system prior to final leak testing, to locate visible leaks. Apply soap bubble mixture to joints and connections; examine for leakage.
2. Correct visible leaks and repeat preliminary test until visible leaks are corrected.
3. Gradually increase pressure in system to half of specified test pressure. Thereafter, increase pressure in steps of approximately one-tenth of specified test pressure until required test pressure is reached.
4. Maintain pneumatic test pressure continuously for minimum of 10 minutes and for such additional time as necessary to conduct soap bubble examination for leakage.
5. Correct visible leakage and retest as specified.

D. Allowable Leakage: Piping system shall show no visual evidence of leakage.

3.04 FIELD QUALITY CONTROL

A. Test Report Documentation:

1. Test date.
2. Description and identification of piping tested.
3. Test fluid.
4. Test pressure.
5. Remarks, including:
   a. Leaks (type, location).
   b. Repair/replacement performed to remedy excessive leakage.
6. Signed by Contractor and Engineer to represent that test has been satisfactorily completed.

1.02 SUMMARY

A. Definition: Camera System Supplier refers to the supplier of the entirety of parts and services as specified herein.

B. Work Includes:

1. Engineering, furnishing, installing, calibrating, configuration, adjusting, testing, documenting, starting up, and Owner training for complete Dam Monitoring Camera System.

2. Major parts are:
   a. Panel enclosures and panel appurtenances including terminal blocks, power supplies, surge protection, circuit breakers, and all other appurtenances for each camera system panel.
   b. Network components and network appurtenances.
c. Cellular data network.

d. Cameras and camera appurtenances.

e. Camera server.

f. Video Management System.

g. All configuration services required for complete and operational camera system.

h. All security configuration services required for complete secure system access.

i. All internet services for setting up and configuring web access, web viewing, and web operations of the camera system from offsite.

j. Camera installation hardware.

k. Installation support services.

l. Testing of the entire system in the field.

m. Training services for Owner.

3. System Description:

a. A camera system will be installed to view the dam, compressor building, and recreational flume at the Zink Dam. Operations staff shall be able to view any of the video image over the Internet in a variety of locations from different devices including cellphones, desktop computers and tablets. The system shall be capable of operating in all weather conditions and equipped with low-light capabilities to view the target area under any conditions. In addition, an onboard camera analytic will be included for the public to view camera feeds online.

b. To view the video feed staff must use a Video Management System (VMS) as specified herein. Using web hosted software, an internal user can view video feeds from the Internet enabled mobile devices or desktop stations with the required software and an internet connection. Using the VMS, authorized users and administrators, but not the general public, shall be able to use the Pan-Tilt-Zoom (PTZ) function of the cameras, configure camera recording settings (light conditions, timing, bandwidth management, etc.), view archived camera images and toggle access to view the system. All web and system software shall be configured and provided by the Camera System Supplier.

c. An analytic hosted on the camera to allow public users to view the camera stream online without allowing any control over the system shall be used as specified herein. The settings and user privileges will be controlled by the VMS operators.

d. Application workshops between the users, integrators and vendors shall be included in order to determine the desired system configuration, camera settings, and to designate responsibilities of the system management.
C. Detailed Design: System as shown and specified includes functional and performance requirements and component specifications. Camera System Supplier shall complete the final detailed system design and configuration.

D. Coordination:

1. Provide extensive coordination with other systems, other suppliers, and other system providers.
   a. Coordination with Section 01 64 00, Owner-Furnished Products.
      1) The Owner-Furnished Products includes network infrastructure that will be used by this section as well as the Owner-Furnished Products.
      2) This includes, but not limited to:
         a) Fiber optic cables and fiber optic patch panels.
         b) Cellular modem system and data plan.
   b. Coordination with Owner-Furnished Gate Control System Supplier:
      1) Refer to Block Diagrams on Drawings.
      2) Camera system will be supplied by Camera System Supplier. Control system will be supplied by the Control System Supplier.
      3) The camera system will share fiber optic infrastructure, and offsite remote cellular access with the PLC/HMI control system after completion of functional testing of each system.
      4) The Camera System will be supplied with a cell modem separately from the control system so that each supplier can test each of the systems for offsite Remote access. However, the Camera System cell modem and cell data plan will be only used for testing and commissioning of the camera system. At the successful completion of each system functional testing, the two systems will share the control system cell modem and data plan. The camera system cell modem system will be kept by the Owner as a spare unit. The purpose for two systems is for checkout of each system independent from the other, while merging them after successful functional testing such that the end user will only log on from offsite remote access to one account with access to each system.
   c. Coordination with Division 26, Electrical: Fiber cabling supplied by Division 26, Electrical.
   d. Coordination with Contractor:
      1) All activities shall be executed in conjunction with Contractor in accordance with:
         a) Section 01 64 35, Contractor's Field Services.
b) Section 01 11 01, Summary of Work for project coordination and project milestones.

c) Section 01 91 14, Equipment Testing and Facility Startup.

   (1) Coordinate all testing requirements.
   (2) Coordinate all delivery of control panels and all other equipment with Contractor and project milestones.

1.03 SUBMITTALS

A. Action Submittals:

1. General:
   a. Shop Drawings, full-scaled details, wiring diagrams, catalog cuts, and descriptive literature.
   b. Identify proposed items and options. Identify installed spares and other provisions for future work (for example, reserved panel space; unused components, wiring, and terminals).
   c. Legends and Abbreviation Lists: Complete definition of symbols and abbreviations used on this Project (for example, engineering units, flow streams, instruments, structures, and other process items used in nameplates, legends, and data sheets).

   a. Group equipment items by enclosure and field, and within an enclosure, as follows:
      1) Components: By component identification code.
      2) Other Equipment: By equipment type.
   b. Data Included:
      1) Equipment tag number.
      2) Description.
      3) Manufacturer, complete model number, and all options not defined by model number.
      4) Quantity supplied.
      5) Component identification code where applicable.

3. Catalog Cuts:
   a. Components, Electrical Devices, Network Devices, and Panels:
      1) Catalog information, mark to identify proposed items and options.
      2) Descriptive literature.
      3) External power and signal connections.
      4) Scaled drawings showing exterior dimensions and locations of electrical and mechanical interfaces.
4. Component Data Sheets: Data sheets for all system components.
   a. Include component type identification code and tag number on data sheet.
   b. Specific features and configuration data for each component:
      1) Location or service.
      2) Manufacturer and complete model number.
      3) Size and scale range.
      4) Setpoints.
      5) Materials of construction.
      6) Options included.
   c. Name, address, and telephone number of manufacturer’s local office, representative, distributor, or service facility.

5. Panel Construction Drawings:
   a. Scale Drawings: Show dimensions and location of panel mounted devices, doors, louvers, and subpanels, internal and external.
   b. Panel Legend: List front of panel devices by tag numbers, nameplate inscriptions, service legends, and annunciator inscriptions.
   c. Bill of Materials: List devices mounted within panel that are not listed in panel legend. Include tag number, description, manufacturer, and model number.
   d. Construction Details: NEMA rating, materials, material thickness, structural stiffeners and brackets, lifting lugs, mounting brackets and tabs, door hinges and latches, and welding and other connection callouts and details.
   e. Construction Notes: Finishes, wire color schemes, wire ratings, wire and terminal block, numbering and labeling scheme.

   a. Diagram Type: Ladder diagrams. Include devices, related to discrete functions, that are mounted in or on the panel and that require electrical connections. Show unique rung numbers on left side of each rung.
   b. Item Identification: Identify each item with attributes listed.
      1) Wires: Wire number and color. Cable number if part of multiconductor cable.
      2) Terminals: Number and tag identification.
      3) Discrete Components: Tag number, terminal numbers, and location (“FIELD”, enclosure number, or cabinet number).
   c. Show each circuit individually. No “typical” diagrams or “typical” wire lists will be permitted.
   d. Ground wires, surge protectors, and connections.

7. Communications and Digital Networks Diagrams:
   a. Scope: Includes connections to all network devices, including but not limited to patch panels, switches, servers, firewall, and all other network equipment.
b. Format: Network schematic diagrams for each different type of network.

c. Show:
   1) Interconnected devices, both passive and active.
   2) Device names and numbers.
   3) Terminal numbers.
   4) Communication Media: Type of cable.
   5) Connection Type: Type of connector.
   6) Node and device address numbers.
   7) Fiber, wire, and cable numbers and colors.

8. Seismic anchorage and bracing data sheets and drawings as required by Section 01 88 15, Anchorage and Bracing.

9. List of spares, expendables, test equipment and tools.

B. Informational Submittals: For all system equipment, provide Manufacturer’s Certificate of Proper Installation and readiness for operation.

1. Owner Training Plan: Reference Section 01 43 33, Manufacturers’ Field Services.

2. Operation and Maintenance (O&M) Manuals: In accordance with Section 01 78 23, Operation and Maintenance Data, unless otherwise specified in this section.
   a. Content and Format:
      1) Complete sets O&M manuals.
      2) Sufficient detail to allow operation, removal, installation, adjustment, calibration, maintenance and purchasing replacements for each PIC component.
      3) Final versions of Legend and Abbreviation Lists.
      4) Manual format in accordance with Section 01 78 23, Operation and Maintenance Data.

b. Include:
   1) All Wiring Diagrams: One reproducible copy to reflect as-built PIC design.
   2) Refer to Paragraph Shop Drawings for the following items:
      a) Bill of Materials.
      b) Catalog Cuts.
      c) Component Data Sheets.
      d) Panel Elementary Wiring Diagrams.
      e) Communications and Digital Networks Diagrams.
      f) Application Camera System Configuration Documentation.
   3) Device O&M manuals for components, electrical devices, network devices, and all other systems include:
      a) Operations procedures.
      b) Installation requirements and procedures.
c) Maintenance requirements and procedures.
d) Troubleshooting procedures.
e) Calibration procedures.
f) Internal schematic and wiring diagrams.
g) Component Calibration Sheets from field quality control calibrations.

4) List of spares, expendables, test equipment and tools provided.

5) List of additional spares, expendables, test equipment and tools recommended.

3. Performance Acceptance Tests (PAT) Submittals:
   a. Final Test Procedures: Final test procedures, forms, and checklists.
   b. Test Documentation: Copy of signed off test procedures when tests are completed.

1.04 SYSTEM CONFIGURATION WORKSHOP

A. Camera System Supplier shall lead and a workshop to ensure conformance with system requirements. The workshop will be held at the Owner’s site. Workshop shall be one session, of up to 8 hours duration.

1. Camera System Supplier to provide necessary information for all workshop topics, lead workshop, manage coordination with attendees and document decisions.

2. Purpose: Coordinate with Owner and Engineer to system requirements, system access, and system configuration meet Owner’s system requirements. Workshop shall be held no less than 30 days prior to system configuration.

B. Workshop Topics:

1. Local camera access.
2. Remote camera access.
3. Remote system access.
4. Any, and all, system settings and configuration requiring input from the Owner.

1.05 OFFSITE REMOTE ACCESS APPLICATION WORKSHOP

A. Gate System Supplier controls team, and Camera System Supplier shall lead an offsite application workshop for coordination, setup, and configuration of the two system access from offsite remote login over cellular network to ensure conformance with end user only logging on via a single cell service and single log in requirement and full access to each of the control system and
the camera system. The workshop will be held at the Owner’s site. Workshop shall be one session of up to 8 hours.

1. All software and panel submittals shall be complete and approved prior to the workshops.
2. Provide all necessary information for all workshop topics, lead the workshop, provide coordination with all attendees, and document all applications software decisions in final software submittal.
3. Purpose: Coordinate with Owner, Camera System Supplier, Gate System Supplier control system team, and Engineer to ensure fully coordinated offsite remote access has been coordinated between the two systems. Workshop to be held no less than 90 days prior to field functional startup.

4. Preparation in Advance:
   a. Coordination with Gate Control System Supplier.
   b. Provide preliminary submittals and receive approval of submittals in advance of the workshop including all preliminary concepts, details, control functionality, alarming, remote access, graphics and all other details for each of the system controls to that require input from the Owner and Engineer.

B. Workshop Topics:

1. System configuration to accommodate single end user offsite remote log on to both the camera system and the control system.
2. Offsite remote access, logon, security, alarms, use, and complete functionality.

C. Required Attendance:

1. Provide for workshop attendance for the following individuals:
   a. Camera System Supplier software configuration individuals responsible for camera systems, camera network configuration, internet services, security configuration, and all other camera system configuration required for offsite remote access to the camera system at the Dam.
   b. Gate System Supplier PLC and HMI software programmer responsible for project PLC and HMI application software.
   c. Camera System Supplier Project Manager.
   d. Owner.
   e. Engineer.
1.06 QUALITY ASSURANCE

A. Calibration Instruments: Each instrument used for calibrating PIC equipment shall bear the seal of a reputable laboratory certifying that instrument has been calibrated within the previous 12 months to a standard endorsed by the NIST.

B. Coordination Meetings:

1. In accordance with Section 01 31 13, Project Coordination.
2. Location: Project site.
3. Attended By: Engineer, Owner, and Contractor.
4. Minimum of two are required. Specific dates will be established in Progress Schedule.
5. First Meeting: Within 120 days after Notice to Proceed.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Provide Site and warehouse storage facilities for PIC equipment.

B. Prior to shipment, include corrosive-inhibitive vapor capsules in shipping containers, and related equipment as recommended by the capsule manufacturer.

C. Prior to installation, store items in dry indoor locations. Provide heating in storage areas for items subject to corrosion under damp conditions.

D. Cover panels and other elements that are exposed to dusty construction environments.

1.08 ENVIRONMENTAL REQUIREMENTS

A. Standard Environmental Requirements:

1. Unless otherwise noted, design equipment for continuous operation in these environments:
   a. Freestanding Panel and Consoles:
      1) Inside, Air Conditioned: NEMA 1.
      2) Inside: NEMA 12.
   b. Smaller Panels and Assemblies (that are not Freestanding):
      1) Inside, Air Conditioned: NEMA 12.
      2) All Other Locations: NEMA 4X.
   c. Field Elements: Outside, NEMA 4X.

B. Environmental Design Requirements: Following defines the types of environments referred to in the above.
1. Inside, air conditioned.
2. Inside:
   a. Temperature: 40 degrees F to 104 degrees F.
   b. Relative Humidity: 10 percent to 95 percent noncondensing.
   c. NEC Classification: Nonhazardous.
3. Outside:
   a. Temperature: Minus 30 degrees F to 113 degrees F.
   b. Relative Humidity: 10 percent to 100 percent.
   c. NEC Classification: Nonhazardous.

1.09 SEQUENCING AND SCHEDULING

A. Activity Completion:

1. The following is a list of key activities and their completion criteria:
   a. Shop Drawings: Reviewed and approved.
   b. Quality Control Submittals: Reviewed and accepted.
   c. Hardware Delivery: Hardware delivered to Site and inventoried by Owner.
   d. PAT: Completed and required test documentation accepted.

B. System Substantial Completion: When Engineer issues Certificate of Substantial Completion.

1. Prerequisites:
   a. All Submittals have been completed.
   b. Successfully completed PAT.
   c. Owner training is on schedule.
   d. All spares, expendables, and test equipment have been delivered to Owner.

C. System Acceptance: Upon written notice of Final Payment and Acceptance.

1. Prerequisites:
   a. Certificate of Substantial Completion.
   b. Punch-list items completed.
   c. Final revisions to O&M manuals accepted.

D. Prerequisite Activities and Lead Times: Do not start the following key Project activities until the prerequisite activities and lead times listed below have been completed and satisfied:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Prerequisites and Lead Times</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submittal reviews by Engineer</td>
<td>Engineer acceptance of Submittal breakdown and schedule.</td>
</tr>
</tbody>
</table>
### Activity | Prerequisites and Lead Times
---|---
Hardware purchasing, fabrication, and assembly | Associated shop drawing Submittals completed.
Shipment | Completion of Shop Drawing Submittals and preliminary O&M manuals.
Owner Training | Owner training plan completed.
PAT | Startup, Owner training, and PAT procedures completed; notice 4 weeks prior to start.

## PART 2 PRODUCTS

### 2.01 GENERAL

A. System shall be as shown on Drawings and as required for network and entire camera system, including remote viewing. Furnish equipment items, configuration, and other services as required. Furnish all materials, equipment, and software, necessary to effect required system performance. Drawings include overall general system requirements. Drawings do not include detailed panel requirements. Quantities of major components are as shown on Drawings. Refer to Camera Network Block Diagram on Drawings. Camera System Supplier shall provide completed final system design with updated drawings, network connections, all appurtenances, additional accessories for a complete system.

1. System Products:
   a. Panel Enclosures:
      1) Main panels.
      2) Camera panels.
   b. Panel Appurtenances:
      1) Power supplies.
      2) Surge protectors.
      3) Breakers.
      4) Terminal blocks.
      5) Connectors.
      6) Wiring.
      7) Labels.
      8) All other panel items required for a UL 508A listed panel system.
   c. Camera Components:
      1) Camera server switch with camera streaming software and Video Management Software.
2) Cameras:
   a) PTZ.
   b) Fixed.

d. Network Components:
   1) Switches.
   2) Fiber patch panels.
   3) Power over Ethernet (POE) injector.
   4) Cell modem.
   5) Data plan.
   6) Fiber patch panels.

e. All necessary appurtenances for a complete and functionally system, including, but not limited to:
   1) Mounting hardware.

2. System Services:
   a. All necessary services for a completely configured and functionally system, including, but not limited to:
      1) All software required for viewing, setting, and troubleshooting including video management software.
      2) All system configuration.

B. First Named Manufacturer: System design is based on first named manufacturers of equipment and materials.

   1. If an item is proposed from other than first named manufacturer, obtain approval from Engineer for such changes in accordance with Article Submittals.
   2. If using proposed item requires other changes, provide work and equipment to implement these changes. Changes that may be required include, but are not limited to: different installation, wiring, raceway, enclosures, connections, isolators, intrinsically safe barriers, software, and accessories.

C. Like Equipment Items:

   1. Use products of one manufacturer and of the same series or family of models to achieve standardization for appearance, operation, maintenance, spare parts, and manufacturer’s services.
   2. Implement all same or similar functions in same or similar manner. For example, control logic, sequence controls, and display layouts.

2.02 CAMERA COMPONENTS

A. Components: Major components for the system are shown on Drawings and as specified herein. Furnish all equipment that is necessary to achieve required system performance.
B. Fixed Camera:

1. Camera:
   a. Image Sensor: Progressive scan RGB CMOS 1/2.5 inch.
   b. Lens:
      1) Varifocal, 3.5-10 mm, F1.7.
      2) 100-degree to 38-degree horizontal field of view.
      3) 51-degree to 22-degree vertical field of view.
   d. Minimum Illumination:
      1) Color: 0.19 lux at 50 IRE, F1.7.
      2) B/W: 0.04 lux at 50 IRE, F1.7, lux with IR illumination on.
   e. Shutter Time: 1/62500 s to 2 s.
   f. Camera Angle Adjustment: Pan plus or minus 180 degrees, tilt minus 40 to plus 75, rotation plus or minus 95 degrees.

2. Video:
   a. Compression: H.264 (MPEG-4 Part 10/AVC) Baseline, main and high profiles motion JPEG.
   b. Resolution: 3840x2160 to 160x90.
   c. Frame Rate: 25/30 fps with frequency at 50/60-Hz.
   d. Streaming: Multiple, individually configurable stream in H.264 and Motion JPEG, controllable frame rate and bandwidth.
   e. Multi-view Streaming: Eight individually cropped out view areas.
   f. Pan/Tilt/Zoom: Digital PTZ, preset positions.
   g. Image Settings: Compression, color, brightness, sharpness, contrast, local contrast, white balance, exposure control, exposure zones, fine tuning at low light, forensic WDR, text and image overlay, privacy masks.

3. Network:
   a. Security: Password protection, IP address filtering, HTTPS encryption, IEEE 802.1X (EAP-TLS) network access control, digest authentication, user access log, centralized management, delay protection, signed firmware.
   b. Protocol Support: Multiple protocols including but not limited to IPv4, IPv6, HTTP, HTTPS, FTP, SFTP, SMTP, Bonjour, SNMP, DHCP, SIP, SOCKS, SSH, LLDP.

4. System Integration:
   a. Application Programming Interface: Open API, including VAPIX and AXIS Camera Application Platform, support for SIP for integration with VoIP systems, peer to peer or integrated with SIP/PBX.
   b. Analytics: Included.
   c. Data Streaming: Event data.
5. General:
   b. Mounting: Bracket with holes for junction boxes for wall mount.
   c. Memory: 1 GB RAM, 512 MB Flash.
   d. Power: Power over Ethernet (PoE).
   e. Connectors: RJ45 10BASE-T/100BASE-TX PoE.
   f. IR Illumination: OptimizedIR with 850 nm IR Led with a range of 100 feet or more.
   g. Storage: SD card and support for recording to network-attached storage (NAS).
   h. Operating Conditions: Minus 40 degrees F to 122 degrees F, maximum temperature 131 degrees F, humidity 10 percent to 100 percent RH.
   i. Approvals: NEMA 4X, NIST SP500-267.
   j. Accessories: Mounting bracket, cable gasket, connector guard, weather shield.
   k. Video management software.
   l. Wall Mount: Aluminum wall mount with 11/2-inch NPS thread compatible with fixed dome and conduit adapters. Cables routed through back hole, or from the side by using conduit connection. Include accessories, as required, to mount cameras.
   m. Surveillance Cabinet: Outdoor ready cabinet, specially designed for outdoor network cameras to protect main power and low-voltage units from weather and vandalism. Include accessories as required to mount and connect the cameras.
   n. Pole Mount: Closed back and cable gasket for insect infestation, IK10 rating for impact resistance, Type 316L stainless steel, easily adjustable to fit poles between 4 inches and 16 inches, and intended for pole mounting of cameras, cabinets. Include accessories as required to mount the cameras to poles.
   o. Power Over Ethernet Module: Powers the camera, 30W, IEEE 802.eaf compliant, with surge protection. Include accessories as required to power the cameras and connect to the network.
   p. Media Convertor: Connects the camera to the network using standard network and fiber optic cable. Include accessories as required to mount the switch and connect to the network.

C. PTZ Camera:

1. Camera: Network camera with dome design with automatically adaptable IR LED illumination enabling surveillance in total darkness up to 200 m.
   a. Image Sensor: Progressive scan CMOS 1/2.8 inch.
   b. Lens:
      1) 4.3 mm to 129 mm, F1.6 – 4.7.
      2) 63.5-degree to 2.3-degree horizontal field of view.
      3) 38.4-degree to 1.3-degree vertical field of view.
      4) Autofocus, auto-iris.
   d. Minimum Illumination:
      1) Color: 0.1 lux at 30 IRE, F1.6.
      2) B/W: 0.008 lux at 30 IRE, F1.7, lux with IR illumination on.
      3) Color: 0.15 lux at 50 IRE, F1.6.
      4) B/W: 0.01 lux at 50 IRE, F1.7, lux with IR illumination on.
   e. Shutter Time: 1/10000 s to 1 s.
   f. Pan/Tilt/Zoom:
      1) Pan: 360 degrees continuous.
      2) Tilt: Plus 20 to minus 90.
      3) Zoom: 30x optical, 12x digital, total 360x zoom.

2. Video:
   a. Compression: H.264 (MPEG-4 Part 10/AVC) Baseline, main and high profiles motion JPEG.
   b. Resolution: 1920x1080 (HDTV 1080p) to 640x360.
   c. Frame Rate: 25/30 or 50/60 fps with frequency at 50/60-Hz in all resolutions.
   d. Streaming: Multiple, individually configurable stream in H.264, H.265, and Motion JPEG, controllable frame rate and bandwidth
   e. Image Settings: Compression, color, brightness, sharpness, contrast, local contrast, white balance, exposure control, exposure zones, fine tuning at low light, forensic WDR, text and image overlay, privacy masks.

3. Network:
   a. Security: Password protection, IP address filtering, HTTPS encryption, IEEE 802.1X (EAP-TLS) network access control, digest authentication, user access log, centralized management, delay protection, signed firmware.
   b. Protocol Support: Multiple protocols including but not limited to IPv4, IPv6, HTTP, HTTPS, FTP, SFTP, SMTP, Bonjour, SNMP, DHCP, SIP, SOCKS, SSH, LLDP.

4. System Integration:
   a. Application Programming Interface: Open API, including VAPIX and AXIS Camera Application Platform, support for SIP for
integration with VoIP systems, peer to peer or integrated with SIP/PBX.

b. Analytics: Included.

c. Data Streaming: Event data.

d. Built-in installation aids.

5. General:

a. Casing: Aluminum NEMA 4X rated, IK08, IK10 housing and mounting, hard coated dome, dehumidifying membrane, encapsulated electronics.

b. Mounting accessories.

c. Memory: 1 GB RAM, 512 MB Flash.

d. Power: Power over Ethernet (PoE).

e. Connectors: RJ45 10BASE-T/100BASE-TX, RJ45 Push-pull Connector (IP66).

f. IR Illumination: OptimizedIR with 850 nm IR Led with a range of 656 feet or more with 60W midspan.

g. Storage: SD card and support for recording to network-attached storage (NAS).

h. Operating Conditions: Minus 58 degrees F to 122 degrees F with 60W midspan, maximum temperature 165 degrees F, humidity 10 percent to 100 percent RH.

i. Approvals: NEMA 4X, NIST SP500-267.

j. Accessories: Mounting bracket, cable gasket, connector guard, weather shield.

k. Video management software.

l. Wall-and-Pole Mount: Aluminum wall mount to quickly connect power and data to the camera through built-in Ethernet cable with IP66 RJ45 connector. Mounting bracket can be flipped over for mounting on wall or pole. Include bracket and, or, strap, accessories, as required, to mount cameras.

m. Power over Ethernet Injector: Powers the camera, 60W, IEEE 802.at compliant, with surge protection. Include accessories as required to power the cameras and connect to the network.

n. Media Convertor: Connects the camera to the network using standard network and fiber optic cable. Include accessories as required to mount the switch and connect to the network.

2.03 NETWORK COMPONENTS

A. Camera POE Switch:

1. Managed hardened gigabit Ethernet switch.
   a. Complies with IEEE 802.3.
   b. Six 10/100/1000 Base-T ports with two combo ports 10/100/1000 Base-T or two 100/1000Base-X SFP ports.
   c. DIN Rail.
   d. Auto-MDI/MDIX.
   e. Store and forward switching.
   f. 1 Mbits packet buffer.
   g. 8K MAC address table.
   h. Dual, redundant, auto-sensing power supply inputs.
   i. Power polarity reverse protection.
   j. Overload current protection.
   k. Port based VLAN.
   l. 801.1Q tag VLAN.
   m. Port trunk with LACP.
   o. IP Security: IP address security management.
   p. Login Security IEEE 802.1X/RADIUS.
   q. SNMP v1 v2c, v3/Web/Telnet/CLI.
   r. DHCP Client/DHCP Server.
   s. TFTP firmware upgrade and configuration backup/restore.
   t. Manufacturer and Model: Transition Networks SISGM1040-262E-LRT.

2. MSA Compliant Fiber Channel SFP Modules: Transition Networks SFP modules to match completed system design.

B. Camera Server Switch:

1. Features:
   a. All-in-one intelligent video surveillance appliance.
   b. All-in-one server, managed PoE switch, and storage.
   c. Fanless design, rated for minus 40 degrees F to 140 degrees F.
   d. Razberi Monitor Health monitoring features.
   e. Razberi CameraDefense cybersecurity features.
   f. Surge protection.
   g. High performance i5-4400E Intel core processor.
   h. Solid state video storage, 2 x 4TB MLD Solid State Drive (2.5-inch SATA 3 Gb/s).
   i. PoE Output up to 200 W: 8 PoE ports.
   j. DIN rail mount chassis.
   k. UL certified.
1. 8 GB DDR3 Memory.
   m. All accessories to accommodate final design.

2. NVR:
   a. Video Management Software:
      1) Open platform architecture.
      3) Perpetual licensing.
      4) Unrestricted number of cameras and servers.
      5) Centralized management.
      6) Microsoft active directory.
      7) Prerecording buffer in RAM.
      8) Hardware accelerated video decoding.
      9) Edge storage.
     10) Scalable video quality recording.
     11) Third-party application integration.
     12) Screen recorder.
     13) Metadata.
     14) Remote site interoperability.
     15) Cybersecurity and user rights.
     16) Monitoring and investigation.
     17) Failover and redundancy.
     18) Manufacturer and Model: Milestone XProtect Professional+ with Milestone Care Plus support services.
   b. Camera Streaming Software:
      1) User-friendly streaming of video content directly to the internet.
      2) Control Room application enabling direct and agile control of the graphics displayed in the live stream, with a convenient real-time view of the camera output. Automated data display, including time and date.
      3) PTZ compass application.
      4) Streaming applications for AXIS IP cameras.
      5) Manufacturer: CamStreamer.

C. Firewall:

   1. All-in-one high performance network security and virtual private network (VPN) gateway.
   2. Fanless, ruggedized design.
   3. Interfaces:
      a. USB Management Port.
      b. Console Port (RJ45).
      c. 4x GE RJ45 Ports.
      d. 2x Shared Media (GE RJ45 ports/GE SFP slots) Pairs.
      e. 1x DB9 Serial Interface.
4. System:
   a. 1.5 Gbps IPv4 firewall throughput.
   b. 4 microsecond latency.
   c. 2.2 Mpps firewall throughput.
   d. 500,000 concurrent sessions (TCP).
   e. 4,000 new sessions per second (TCP).
   f. 5,000 firewall policies.
   g. 1 Gbps IPsec VPN throughput.
   h. 200 gateway-gateway VPN tunnels.
   i. 500 client-gateway VPN tunnels.
   j. 30 Mbps SSL-VPN throughput.
   k. 100 concurrent SSL-VPN users.
   l. 95 Mbps application control throughput.
   m. Maximum 10 virtual domains.
   n. Maximum 10 Aps.
   o. Maximum 100 tokens.
   p. Maximum 200 registered clients.
   q. Active-active, active-passive, and clustering high availability configurations.

5. Security Services: Bundle - 24/7 Enterprise Protection.

6. Compliance: FCC Part 15 Class A, C-Tick, CE, UL/cUL, CB.

7. Mobile Password Application with Push Notification:
   a. One-time password application with push notification.
   b. Two-factor solution for authentication.
   c. Android, iOS, Windows mobile device compatible.
   d. Push notification view login on mobile device.

D. Fiber Optic Patch Panel:

   1. Compact DIN-Rail, or surface, mounted fiber optic patch panel sized to match quantity of single mode fibers, per Division 26 Electrical, and as shown on Drawings.
   2. UL Listed 1863, CE.
   3. 18-gauge powder-coat painted steel.
   4. UL 90 V-0 thermoplastic fiber optic adapters.
   5. Plastic cable glands as required for cable size and fiber quantity.
   7. Manufacturer and Model: Dinspace, SNAP XL Compact Fiber Optic Patch Panel.

E. Industrial Cell Modem and Antenna:

   1. Provide real-time remote connectivity.
2. DIN rail mount with accessory bracket.
3. Low power consumption, 2G with LTE performance at 900 mW in idle.
4. Support wide range of LTE bands and LTE-advanced up to 300 Mbps downlink speeds.
5. Fully automatic network operator switching (insert SIM).
6. Network connectivity via Ethernet, Serial, and USB.
7. Dual-SIM functionality to enable automatic failover between SIMs.
8. Support up to five VPN tunnels for secure cellular communications.
9. Remote configuration, software update, and monitoring with cloud-based management services or on-premises with Mobility Manager.
10. Certifications:
   a. Safety: IEC EE CB Scheme UL 60950.
11. Antenna:
   a. Low profile housing.
   b. Ground plane independent.
   c. Omni directional patterned with two antenna elements with effective isolation and correlation covering all current global cellular and LTE bands in frequency range 698-960/1710-3800 MHz, and active GNSS antenna for positioning or timing and single Wi-Fi element.
   d. Greater than 50 percent efficiency.
12. Manufacturer and Product:
   a. Sierra Wireless AirLink RV50X with Wireless AirLink Antenna: 4-in-1 panel. Provide 5G unlimited plan with 4G LTE up to 75 GB for remote access.
13. Account shall be provided and paid by Gate System Supplier thru substantial completion at which time the account shall be switched to end user.
14. Account shall be set up in the end user name.

2.04 NAMEPLATES AND TAGS

A. Panel Nameplates: Enclosure identification located on the enclosure face.
   1. Location and inscription.
   2. Materials: Laminated plastic attached to panel with stainless steel screws.
   3. Letters: 1/2-inch white on black background, unless otherwise noted.

B. Component Nameplates—Panel Face: Component identification located on panel face under or near component.
   1. Location and inscription.
   2. Materials: Laminated plastic attached to panel with stainless steel screws.
3. Letters: 3/16-inch white on black background, unless otherwise noted.

C. Component Nameplates—Back of Panel: Component identification located on or near component inside of enclosure.
   1. Inscription: Component tag number.
   3. Letters: 3/16-inch white on black background, unless otherwise noted.

D. Service Legends: Component identification nameplate located on face of component.
   1. Inscription: As shown.
   3. Letters: 3/16-inch white on black background, unless otherwise noted.

E. Nametags: Component identification for field devices.
   1. Inscription: Component tag number.
   4. Mounting: Affix to component with 16-gauge or 18-gauge stainless steel wire or stainless steel screws.

2.05 ELECTRICAL REQUIREMENTS

A. In accordance with Division 26, Electrical.

B. System and Electrical Components, Terminals, Wires, and Enclosures: UL recognized or UL listed.

C. Wires within Enclosures:
   1. ac Circuits:
      a. Type: 600-volt, Type MTW stranded copper.
      b. Size: For current to be carried, but not less than 16 AWG.
   2. Analog Signal Circuits:
      a. Type: 300-volt stranded copper, twisted shielded pairs.
      b. Size: 18 AWG, minimum.
   3. Other dc Circuits:
      a. Type: 300-volt, Type MTW stranded copper.
      b. Size: For current carried, but not less than 18 AWG.
   5. Wire Identification: Numbered and tagged at each termination.
      a. Wire Tags: Machine printed, heat shrink.
      b. Manufacturers:
ZINK DAM IMPROVEMENTS

1) Brady PermaSleeve.
2) Tyco Electronics.

D. Wires entering or leaving enclosures, terminate and identify as follows:

1. Analog and discrete signal, terminate at numbered terminal blocks.
2. Special signals, terminated using manufacturer’s standard connectors.
3. Identify wiring in accordance with Section 26 05 05, Conductors.

E. Terminal Blocks for Enclosures:

1. Quantity:
   a. Accommodate present and spare indicated needs.
   b. Wire spare PLC I/O points to terminal blocks.
   c. One wire per terminal for field wires entering enclosures.
   d. Maximum of two wires per terminal for internal enclosure wiring.
   e. Spare Terminals: 20 percent of all connected terminals, but not less than 10 per terminal block.
2. General:
   a. Connection Type: Screw compression clamp.
   b. Compression Clamp:
      1) Complies with DIN-VDE 0611.
      2) Hardened steel clamp with transversal groves that penetrate wire strands providing a vibration-proof connection.
      3) Guides strands of wire into terminal.
   d. Current Bar: Copper or treated brass.
   e. Insulation:
      1) Thermoplastic rated for minus 55 degrees F to plus 110 degrees C.
      2) Two funneled shaped inputs to facilitate wire entry.
   f. Mounting:
      1) Standard DIN rail.
      2) Terminal block can be extracted from an assembly without displacing adjacent blocks.
      3) End Stops: Minimum of one at each end of rail.
   g. Wire Preparation: Stripping only permitted.
   h. Jumpers: Allow jumper installation without loss of space on terminal or rail.
   i. Features:
      1) Color: Gray or beige body, or as noted.
      2) Spacing: 0.25 inch, or as noted.
      3) Rated Wire Size: 10 AWG.
   j. Marking System:
      1) Terminal number shown on both sides of terminal block.
2) Allow use of preprinted and field marked tags.
3) Terminal strip numbers shown on end stops.
4) Mark terminal block and terminal strip numbers as shown on Panel Control Diagrams and Loop Diagrams.
5) Fuse Marking for Fused Terminal Blocks: Fuse voltage and amperage rating shown on top of terminal block.

k. Manufacturers:
   1) Entrelec.
   2) Phoenix Contact.

3. Terminal Block, General-Purpose:
   a. Rated Voltage: 600V ac.
   b. Rated Current: 30-amp.
   c. Wire Size: 22 AWG to 10 AWG.

4. Terminal Block, Ground:
   a. Wire Size: 22 AWG to 12 AWG.
   b. Color: Green and yellow body.
   c. Grounding: Ground terminal blocks electrically grounded to the mounting rail.

5. Terminal Block, Blade Disconnect Switch:
   a. Rated Voltage: 600V ac.
   b. Rated Current: 10-amp.
   c. Wire Size: 22 AWG to 12 AWG.
   d. Color: Grey body, orange switch.

6. Terminal Block, Fused, 24V dc:
   a. Rated Voltage: 600V dc.
   b. Rated Current: 16-amp.
   c. Wire Size: 22 AWG to 10 AWG.
   d. Fuse: 0.25 inch by 1.25 inches.
   e. Indication: LED diode 24V dc.
   f. Spacing: 0.512 inch, maximum.

7. Terminal Block, Fused, 120V ac:
   a. Rated Voltage: 600V ac.
   b. Rated Current: 16-amp.
   c. Wire Size: 22 AWG to 10 AWG.
   d. Fuse: 0.25 inch by 1.25 inches.
   e. Indication: Neon Lamp 110V ac.
   f. Leakage Current: 1.8 mA, maximum.
   g. Spacing: 0.512 inch, maximum

8. Terminal Block, Fused, 120V ac, High Current:
   a. Rated Voltage: 600V ac.
   b. Rated Current: 35-amp.
   c. Wire Size: 18 AWG to 8 AWG.
   d. Rated Wire Size: 8 AWG.
   e. Fuse: 13/32 inch by 1.5 inches.
   f. Spacing: 0.95 inch, maximum.
F. Grounding of Enclosures:

1. Ground enclosure back panel and metal enclosure.
2. Ground power circuits at a common ground point in accordance with National Electrical Code requirements.
3. Single Point Ground for Each Analog Loop:
   a. Use to ground wire shields for loop.
   b. Provide dedicated grounded terminal block for each loop.
4. Ground terminal block rails.

G. Power Supplies:

1. Furnish to power instruments requiring external dc power, including two-wire transmitters and dc relays. Provide dual power supplies with diode auctioneered outputs.
2. Convert 120V ac, 60-Hz power to dc power of appropriate voltage(s) with sufficient voltage regulation and ripple control to assure that instruments being supplied can operate within their required tolerances.
3. Provide output over voltage and over current protective devices to:
   a. Protect instruments from damage due to power supply failure.
   b. Protect power supply from damage due to external failure.
4. Enclosures: NEMA 1 in accordance with NEMA 250.
5. Mount such that dissipated heat does not adversely affect other components.
6. Fuses: For each dc supply line to each individual two-wire transmitter.
   a. Type: Indicating.
   b. Mount so fuses can be easily seen and replaced.

H. Uninterruptible Power System (UPS):

1. UPS shall be provided inside control panels as shown in the Contract Documents.
2. The UPS shall be on-line, computer-grade, double conversion type, with electrical isolation including output neutral.
   a. Nominal Input Voltage: 120V ac.
   b. Nominal Output Voltage: 120V ac.
3. The online UPS system shall be provided with integral sealed no maintenance batteries, sized to provide full capacity backup power for 30-minute minimum at connected load with integral battery charger.
4. The Camera System Supplier shall calculate the required kVA rating at 150 percent of connected load. Submit load calculations, schematic diagrams, and wiring connection diagrams. Provide battery cabling and other required cabling for a complete system.
5. The UPS shall be DIN rail mounted within the panel or on a pedestal or tray with stainless-steel legs to provide space for wire entry and passage.

6. Uninterruptible power supply systems shall be as manufactured by American Power Conversion APC DIN Rail – Panel Mount UPS, or Phoenix Contact.

I. Surge Protectors: Provide Type 1 surge protective devices, per NEC Article 285, at the power feed to the panel. Surge Protective Devices (SPD) shall be designed to provide transient voltage protection for a service entrance panelboard. SPD units shall comply with UL 1449 3rd Edition, and shall be listed for such use. SPD units shall be rated for the voltage and phase service of the panel at 120 kA per phase. SPD units shall have a built-in diagnostic package with flashing trouble indicator, a display for the status of each phase, and a counter and display to indicate the number of surges that have caused the device to operate.

J. Power Distribution within Panels:

1. Feeder Circuits:
   a. One or more 120V ac, 60-Hz feeder circuits.
   b. Make provisions for feeder circuit conduit entry.
   c. Furnish terminal board for termination of wires.

2. Power Distribution: Furnish main circuit breaker and a circuit breaker on each individual branch circuit distributed from power panel.
   a. Locate to provide clear view of and access to breakers when door is open.
   b. Breaker Sizes: Coordinate such that fault in branch circuit will trip only branch breaker but not trip the main breaker.
      1) Branch Circuit Breaker: 15 amps at 250V ac.
   c. Breaker Manufacturers and Products: Refer to Division 26, Electrical.

3. Circuit Wiring:
   a. Use following rules for actual circuit wiring:
      1) Devices on Single Circuit: 20, maximum.
      2) Multiple Units Performing Parallel Operations: To prevent failure of any single branch circuit from shutting down entire operation, do not group all units on same branch circuit.
      3) Branch Circuit Loading: 12 amperes continuous, maximum.
      4) Panel Lighting and Service Outlets: Put on separate 15-amp, 120V ac branch circuit.
      5) Provide 120V ac plug mold for panel components with line cords.
K. Internal Panel Lights for Freestanding Panels:
   1. Type: Switched 15-watt LED back-of-panel lights.
   2. Quantity: One light for every 4 feet of panel width.
   3. Mounting: Inside and in the top of back-of-panel area.
   5. Protective metal shield for lights.

2.07 EXPENDABLES

A. Corrosion-Inhibiting Vapor Capsules: Manufacturer’s recommended 2-year supply.

2.08 FABRICATION

A. General:
   1. Panels with external dimensions up to the dimension as shown on Drawings.
   2. Panel Construction and Interior Wiring: In accordance with the National Electrical Code, state and local codes, NEMA, ANSI, UL, and ICECA.
   3. Fabricate panels, install instruments, wire, and plumb, at the PIC factory.
   4. Electrical Work: In accordance with Division 26, Electrical.

B. Factory Assembly: Assemble panels at the manufacturer’s factory. No fabrication other than correction of minor defects or minor transit damage shall be done on panels at Site.

C. UL Listing Mark for Enclosures: Mark stating “Listed Enclosed Industrial Control Panel” per UL 508A.

D. Wiring Within System Panels:
   1. Restrain by plastic ties or ducts or metal raceways.
2. Hinge Wiring: Secure at each end so that bending or twisting will be around longitudinal axis of wire. Protect bend area with sleeve.
3. Arrange wiring neatly, cut to proper length, and remove surplus wire.
4. Abrasion protection for wire bundles which pass through holes or across edges of sheet metal.
5. Network connectors.
6. Connections to Screw Type Terminals:
   a. Locking-fork-tongue or ring-tongue lugs.
   b. Use manufacturer’s recommended tool with required sized anvil to make crimp lug terminations.
   c. Wires terminated in a crimp lug, maximum of one.
   d. Lugs installed on a screw terminal, maximum of two.
7. Connections to Compression Clamp Type Terminals:
   a. Strip, prepare, and install wires in accordance with terminal manufacturer’s recommendations.
   b. Wires installed in a compression screw and clamp, maximum of one for field wires entering enclosure, otherwise maximum of two.
8. Splicing and tapping of wires, allowed only at device terminals or terminal blocks.
9. Terminate 24V dc and analog signal circuits on separate terminal block from ac circuit terminal blocks.
10. Separate analog and dc circuits by at least 6 inches from ac power and control wiring, except at unavoidable crossover points and at device terminations.
11. Arrange wiring to allow access for testing, removal, and maintenance of circuits and components.

E. Temperature Control:

1. Freestanding Panels:
   a. Nonventilated Panels: Size to adequately dissipate heat from equipment mounted inside panel or on panel.
   b. Ventilated Panels:
      1) Furnish with louvers and forced ventilation as required to prevent temperature buildup from equipment mounted inside panel or on panel.
      2) For panels with backs against wall, furnish louvers on top and bottom of panel sides.
      3) For panels without backs against wall, furnish louvers on top and bottom of panel back.
      4) Louver Construction: Stamped sheet metal.
5) Ventilation Fans:
   a) Furnish where required to provide adequate cooling.
   b) Create positive internal pressure within panel.
   c) Fan Motor Power: 120V ac, 60-Hz, thermostatically controlled.

6) Air Filters: Washable aluminum, Hoffman Series A-FLT.
   c. Refrigerated System: Furnish for all interior network system panels. External camera panels shall include a temperature controlled heater.

F. Freestanding Panel Construction:

1. Materials: Sheet steel, unless otherwise shown on Drawings with minimum thickness of 10-gauge, unless otherwise noted.
2. Panel Fronts:
   a. Fabricated from a single piece of sheet steel, unless otherwise shown on Drawings.
   b. No seams or bolt heads visible when viewed from front.
   c. Panel Cutouts: Smoothly finished with rounded edges.
   d. Stiffeners: Steel angle or plate stiffeners or both on back of panel face to prevent panel deflection under instrument loading or operation.
3. Internal Framework:
   a. Structural steel for instrument support and panel bracing.
   b. Permit panel lifting without racking or distortion.
4. Lifting rings to allow simple, safe rigging and lifting of panel during installation.
5. Adjacent Panels: Securely bolted together so front faces are parallel.
6. Doors: Full height, fully gasketed access doors where shown on Drawings.
   a. Latches: Three-point, Southco Type 44.
   c. Hinges: Full length, continuous, piano type, steel hinges with stainless steel pins.
   d. Access Doors: Extend no further than 36 inches beyond panel when opened to 90-degree position.

G. Nonfreestanding Panel Construction:

1. Based on environmental design requirements required and referenced in Article Environmental Requirements, provide the following:
   a. For panels listed as inside, air conditioned:
      1) Enclosure Type: NEMA 12 in accordance with NEMA 250.
      2) Materials: Steel.
b. For All Other Panels:
   1) Enclosure Type: NEMA 4X in accordance with NEMA 250.
   2) Materials: Type 316 stainless steel.
3. Doors:
   a. Rubber-gasketed with continuous hinge.
   b. Stainless steel lockable quick-release clamps.
4. Manufacturers:
   b. Rittal.

H. Factory Finishing:

1. Enclosures:
   a. Stainless Steel and Aluminum: Not painted.
   c. Steel Panels:
      1) Sand panel and remove mill scale, rust, grease, and oil.
      2) Fill imperfections and sand smooth.
      3) Paint panel interior and exterior with one coat of epoxy coating metal primer, two finish coats of two-component type epoxy enamel.
      4) Sand surfaces lightly between coats.
      5) Dry Film Thickness: 3 mils, minimum.
2. Manufacturer’s standard finish color, except where specific color is indicated. If manufacturer has no standard color, finish equipment with light gray color.

2.09 CORROSION PROTECTION

A. Corrosion-Inhibiting Vapor Capsule Manufacturers:
   1. Northern Instruments; Model Zerust VC.
   2. Hoffmann Engineering Co; Model A-HCI.

2.10 SOURCE QUALITY CONTROL

A. Scope: Inspect and test entire system to ensure it is ready for shipment, installation, and operation.

B. Location: Manufacturer’s factory or staging Site.

C. Test: Exercise and test all functions.

D. Demonstrate the complete camera system in its entirety is functional and ready for field installation.
PART 3 EXECUTION

3.01 EXAMINATION

A. For equipment and cabling not provided by Camera System Supplier, but that directly interfaces with the camera system, verify the following conditions:

1. Proper installation.
2. Cable installation.
3. Proper cable testing.

3.02 INSTALLATION

A. Material and Equipment Installation: Retain a copy of manufacturers’ instructions at Site, available for review at all times.

B. Electrical Wiring: As specified in Division 26, Electrical.

1. Enclosure Lifting Rings: Remove rings following installation and plug holes.

3.03 FIELD FINISHING

A. Refer to Section 09 90 00, Painting and Coating.

3.04 FIELD QUALITY CONTROL

A. Startup and Testing Team:

1. Thoroughly inspect installation, termination, and adjustment for components and systems.
2. Complete onsite tests.
3. Complete onsite training.
4. Provide startup assistance.

B. Operational Readiness Inspections and Calibrations and Functional Testing: Prior to startup, inspect and test to ensure that entire system is ready for operation.

1. Component Inspections and Calibrations:
   a. Check all system components for proper installation, calibration, and adjustment on a loop-by-loop and component-by-component basis.
   b. Prepare component calibration sheet for each active system component.
      1) Project name.
      2) Component tag number.
3) Manufacturer for elements.
4) Model number/serial number.
5) Summary of functional requirements, for example:
   a) Camera communication to server.
   b) Camera communication to remote offsite internet.
   c) Camera PTZ local and remote controls.
   d) Remote access and login.
6) Calibrations, for example:
   a) Camera Devices: Actual signal inputs to the video server and actual outputs, via remote cellular communications, to the internet.

c. Functional Testing:
   1) Test every camera for complete functionality from the camera to each switch and to the web over cell modem.
   2) Test all server configuration functionality.
   3) Test all camera streaming functionality.
   4) Test offsite remote logon functionality.

C. Performance Acceptance Tests (PAT): These are the activities that Section 01 91 14, Equipment Testing and Facility Startup, refers to as Performance Testing.

1. General:
   a. Test all system components to demonstrate each component and the entire system satisfies all system requirements.
   b. Test Format: Cause and effect.
      1) Person conducting test initiates an input (cause).
      2) Specific test requirement is satisfied if correct result (effect) occurs.
   c. Procedures, Forms, and Checklists:
      1) Conduct tests in accordance with, and documented on, Engineer accepted procedures, forms, and checklists.
      2) Describe each test item to be performed.
      3) Have space after each test item description for sign off by appropriate party after satisfactory completion.
   d. Required Test Documentation: Test procedures, forms, and checklists. All signed by Engineer and Contractor.
   e. Conducting Tests:
      1) Provide special testing materials, equipment, and software.
      2) Perform tests using actual equipment and data.
      3) Define simulation techniques in test procedures.
   f. Coordinate system testing with Owner and affected Subcontractors.
      1) Excessive Test Witnessing: Refer to Supplementary Conditions.
2. Test Requirements:
   a. Once facility has been started up and is operating, perform a witnessed final acceptance test on complete system to demonstrate that it is operating as required. Demonstrate each required function on a paragraph-by-paragraph and loop-by-loop basis.
   b. Perform local and manual tests for each device before proceeding to remote monitoring and access.
   c. Make updated versions of documentation required for final acceptance test available to Engineer at Site, both before and during tests.
   d. Make one copy of O&M manuals available to Engineer at the Site both before and during testing.

3.05 MANUFACTURER’S SERVICES

A. Specialty Equipment: For following equipment, provide the services of a qualified manufacturer’s representative during installation, startup, and demonstration testing and Owner training.

3.06 TRAINING

A. General:
   1. Provide an integrated training program to meet specific needs of Owner’s personnel.
   2. Include training sessions, classroom and field, for operators and maintenance personnel.
   3. Owner reserves the right to make and reuse video tapes of training sessions.

B. Operations and Maintenance Training:
   1. Include a review of O&M manuals and survey of spares, expendables, and test equipment.
   2. Use equipment similar to that provided or currently owned by Owner.

C. Operations Training:
   1. Training Session Duration: 4-hour instructor day.
   2. Number of Training Sessions: Two.
   3. Location: Project Site.
   4. Content: Conduct training on camera-by-camera basis.
      a. Functions: Understanding of camera functions, including camera adjustability and remote monitoring for each camera.
      b. Interfaces with other systems.
D. Maintenance Training:

1. Training Session Duration: 3-hour instructor day.
2. Number of Training Sessions: Two.
3. Location: Project Site.
4. Content: Provide training for each type of component and function provided.
   a. Camera and System Functions: Understanding details of each camera, or system component, and how they function.
   b. Component calibration.
   c. Camera or system component adjustments troubleshooting and diagnosis for components.
   d. Replacing each type of system components.
   e. Component removal and replacement.
   f. Periodic maintenance.

3.07 CLEANING/ADJUSTING

A. Repair affected surfaces to conform to type, quality, and finish of surrounding surface.

B. Cleaning:

1. Prior to closing system using tubing, clear tubing of interior moisture and debris.
2. Upon completion of Work, remove materials, scraps, and debris from interior and exterior of equipment.

3.08 PROTECTION

A. Protect enclosures and other equipment containing electrical, instrumentation and control devices, including spare parts, from corrosion through the use of corrosion-inhibiting vapor capsules.

B. Periodically replace capsules in accordance with capsule manufacturer’s recommendations. Replace capsules just prior to Final Payment and Acceptance.

END OF SECTION
