

Nitrification Control in the Distribution System to Reduce Resource Requirements

—
Lean Six Sigma Black Belt Project
by
pHishbone out of H₂O

January 25, 2018

Project team

- Team members:
 - Melissa Gray, Project Manager, LSS black belt candidate
 - Stefanie Hunter, LSS black belt candidate
 - Eric Lee, LSS black belt candidate
 - Eric Parker, LSS black belt candidate
 - Benita Becton, LSS green belt
 - Jhoanna Murray, LSS green belt

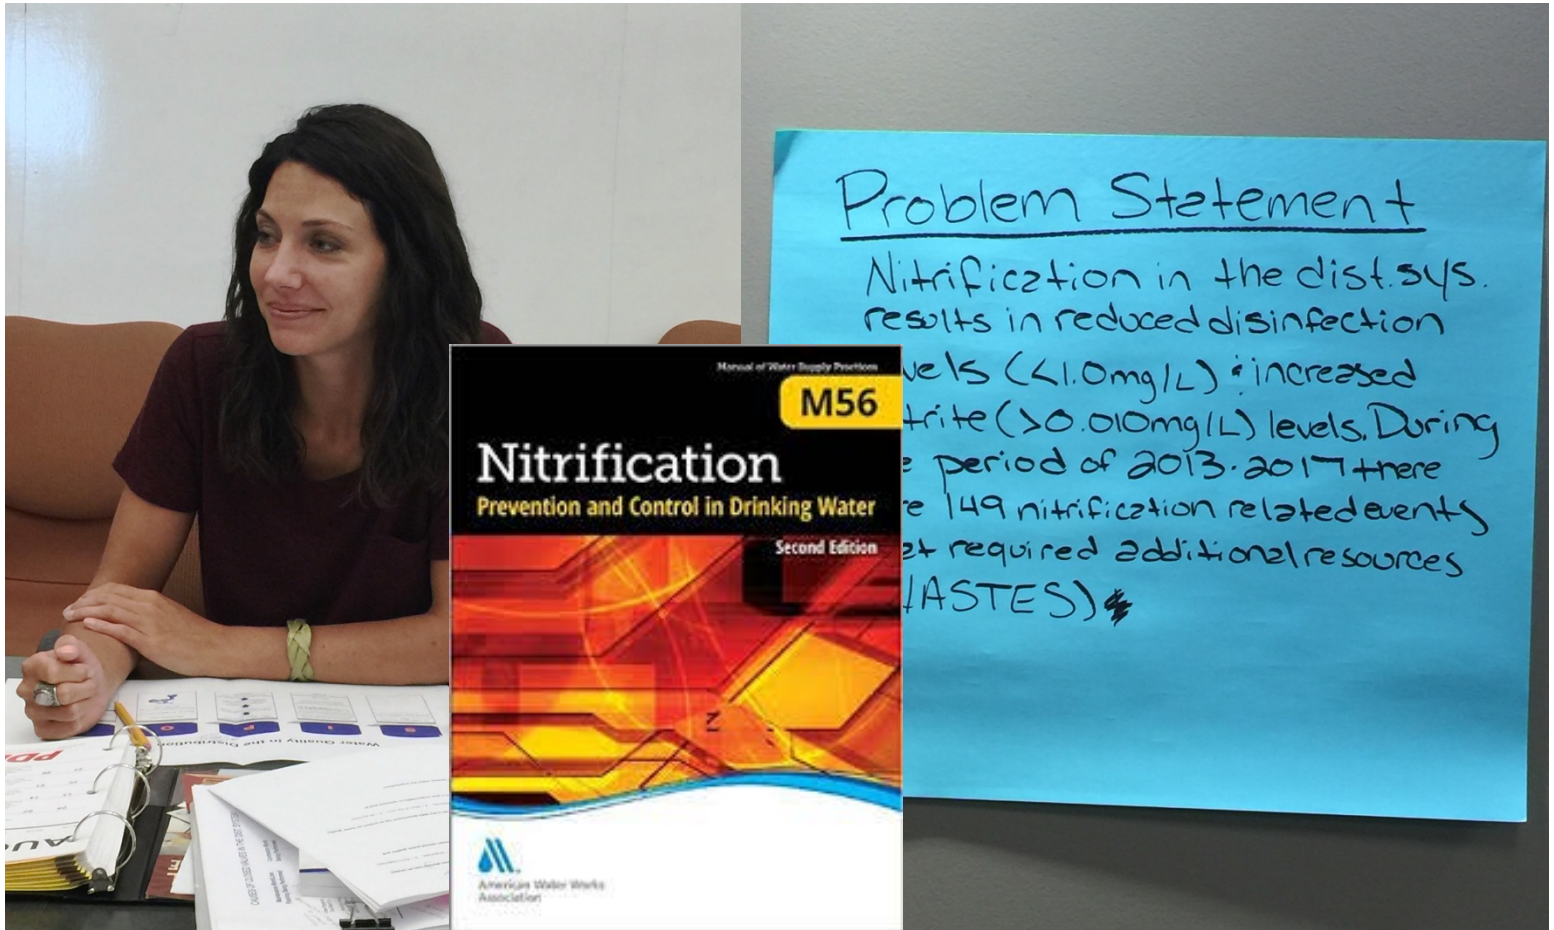

pHishbone out of H₂O

Training and project

- Classroom training conducted August 1st through August 31st
 - Conducted by Walter Miller and Mark Reid through Oklahoma City Community College
- Project team met each Thursday afternoon from September 2017 to January 2018
- Benita Becton and Jhoanna Murray were added to the team as the project progressed

Problem Statement

Nitrification in the dist. sys. results in reduced disinfection levels ($<1.0\text{mg/L}$): increased nitrite ($>0.010\text{mg/L}$) levels. During the period of 2013-2017 there were 149 nitrification related events that required additional resources (WASTES) ⚡

Define Phase

Project selection and process

- Nitrification Control in the Distribution System to Reduce Resource Requirements
 - Historical data related to nitrification in the distribution system was analyzed to determine if there were opportunities available to reduce the amount of resources required to respond to water quality events that required additional resources

History

- In July 2012, the City of Tulsa switched from chlorine to chloramines for secondary disinfection of the water distribution system.
- The switch was to ensure compliance with the EPA's Stage 2 Disinfectants and Disinfection Byproducts Rule.
- The regulation reduces the risk of disinfection byproducts that can form when free chlorine combines with naturally occurring organic matter in the water.

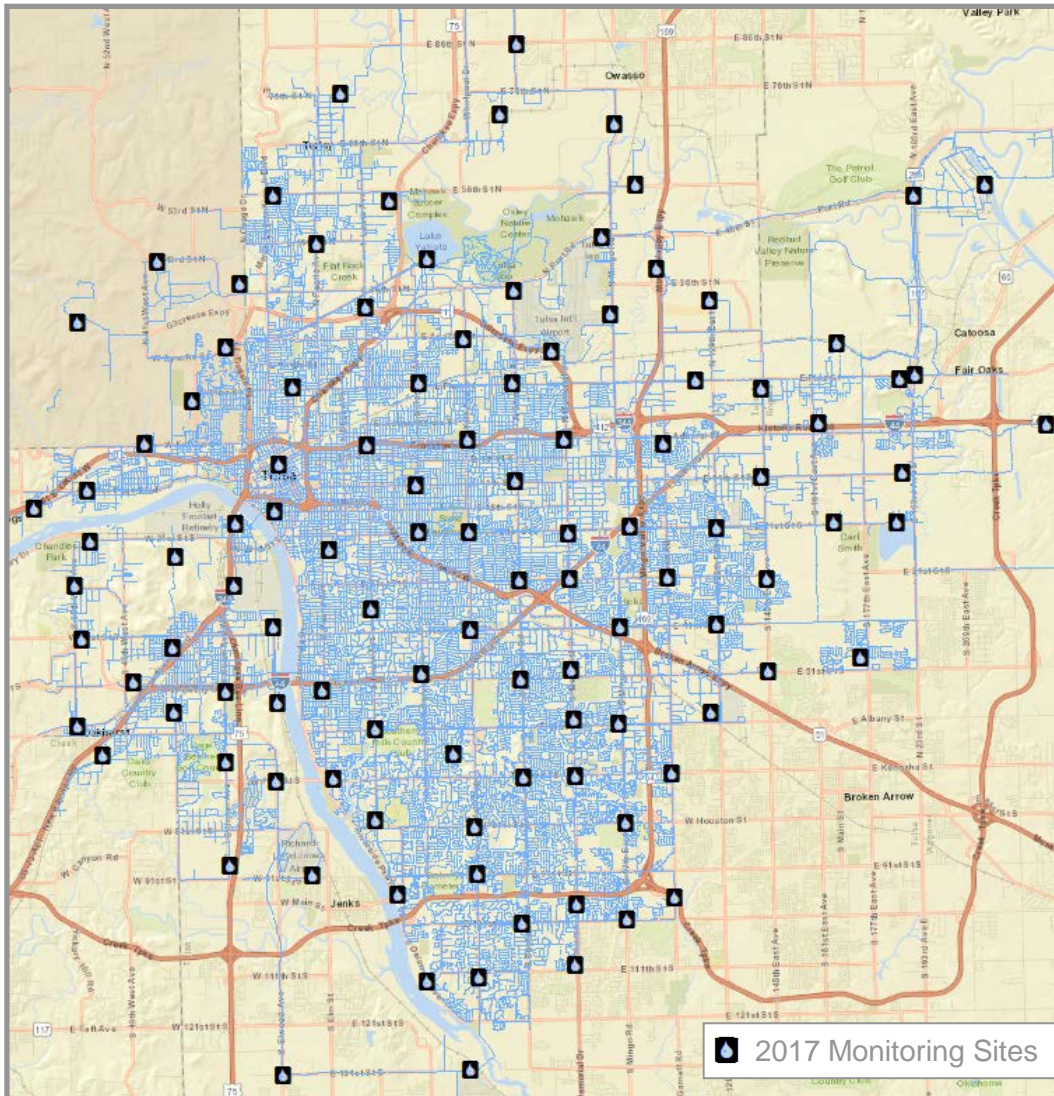

What is nitrification?

- Chloramines are formed by adding ammonia that binds to the free chlorine.
- Nitrification occurs when microbes present in the biofilm lining the distribution pipes consume the available ammonia then sequentially oxidize it to form nitrites and nitrates, which are regulated contaminants.

2017 Monitoring sites

Compliance Monitoring

- 111 sites approved by ODEQ
- Monitored twice monthly
- Minimum of 2,664 annual tests

Nitrite Monitoring

- Goes above and beyond compliance
- Early detection/mitigation of potential nitrification conditions

Nitrification Monitoring and Response

- Storage tanks are located throughout the City to equalize daily demands and to ensure adequate pressures throughout the water supply system.
- Tanks provide critical storage needed for firefighting purposes.
- Of the City's total storage capacity of roughly 104.5 million gallons, the four tanks located at 61st and Sheridan account for just over half of that capacity.

Project charter

 CITY OF Tulsa <i>A New Kind of Energy.</i>	WATER & SEWER DEPARTMENT	Revision No.:	
	Six Sigma Info Gathering	Date Created:	8/24/2017
		Date Revised:	
		Approved by:	
		Number:	Control #
		Section:	Division/Section
W&S Project Info Gathering Checklist			
Team Members	Project Name	Nitrification Control in the Distribution System to Reduce Resource Requirements	
	Date Project Initiated	August 24, 2017	
	Executive Sponsor:	Clayton Edwards, W&S Director	
	Project Champion:	Jo Brown, WQA Manager	
	Black Belt Advisors:	Walter Miller, Eschelon LLC; Robyn Unideme, OPSI Project Manager	
	Team Members:	Stefanie Hunter, Eric Lee, Eric Parker, Melissa Gray	
Process	Process being evaluated:	Reducing nitrification exceedances in Tulsa's water distribution system	
	Process Owner(s) - Individual(s) responsible for the business process being evaluated.	Roy Foster, Water Supply Systems; Jo Brown, Water Quality Assurance; Eric Parker, Water Distribution Systems	
	What is the output from the process? (e.g. work product? Report? Inspection? Permit?)	Improved drinking water quality to utility customers, less time expended on remedial sampling, less water consumed due to unnecessary flushing, improved compliance with Federal Regulations	
	Process Stakeholders (Who will be affected by the potential outcome)	Water Quality Assurance Field Staff, Water Distribution Maintenance Crews, Water Supply, Engineering Inspectors, Contractors, Utility Customers, TMUA, elected officials

Black Belt	Penny Macias	Project Manager OPSI

Problem statement

- Nitrification related water quality events in the distribution system can result in reduced disinfection levels (<1.0 mg/L total Cl₂) and increased nitrite (>0.010 mg/L) levels. During the period of January 2013 – August 2017, there were 149 nitrification related events that required additional resources including multiple site visits, repeated sampling, and/or large amounts of treated water required to flush distribution lines and fill the multi-million gallon storage tanks that were drained.

Improve Phase

Improve phase – Focus group & Affinity diagram

Improve phase – Focus group results

Contributing Factors as Identified by Front-Line Employees

Improve phase – Using survey results

- Focus Group and survey results – Water Distribution, Water Supply, Quality Assurance, Engineering Services
 - Employees feel a high standard of water quality exists in the City of Tulsa
 - Few employees felt they directly impacted water quality in the system
 - Many employees not aware of water quality indicators or how actions performed in the distribution system can directly affect water age and quality

Improve phase – Solution selection method

- Using results of focus group, survey, fishbone diagram (Ishikawa), etc., the primary contributing factors are:
 - Water age
 - Water temperature
 - Employee (and contractor) knowledge
- The solution is:
 - Optimizing control of storage tank levels
 - Error proof (poka-yoke) valve opening and closing procedures
 - Employee education and training

Control Phase

Control phase – Plant standard operating guideline (SOG) and plant controls

 CITY OF Tulsa A New Kind of Energy.	MOHAWK STANDARD OPERATING GUIDELINES (SOGs)	Revision No.:	
	Sheridan Level Control	Date Created: 01/18/2018 Date Revised: Approved by: D. Davis/E. Prock Number: MOH Section: PROCESS/EQUIPMENT	

Introduction

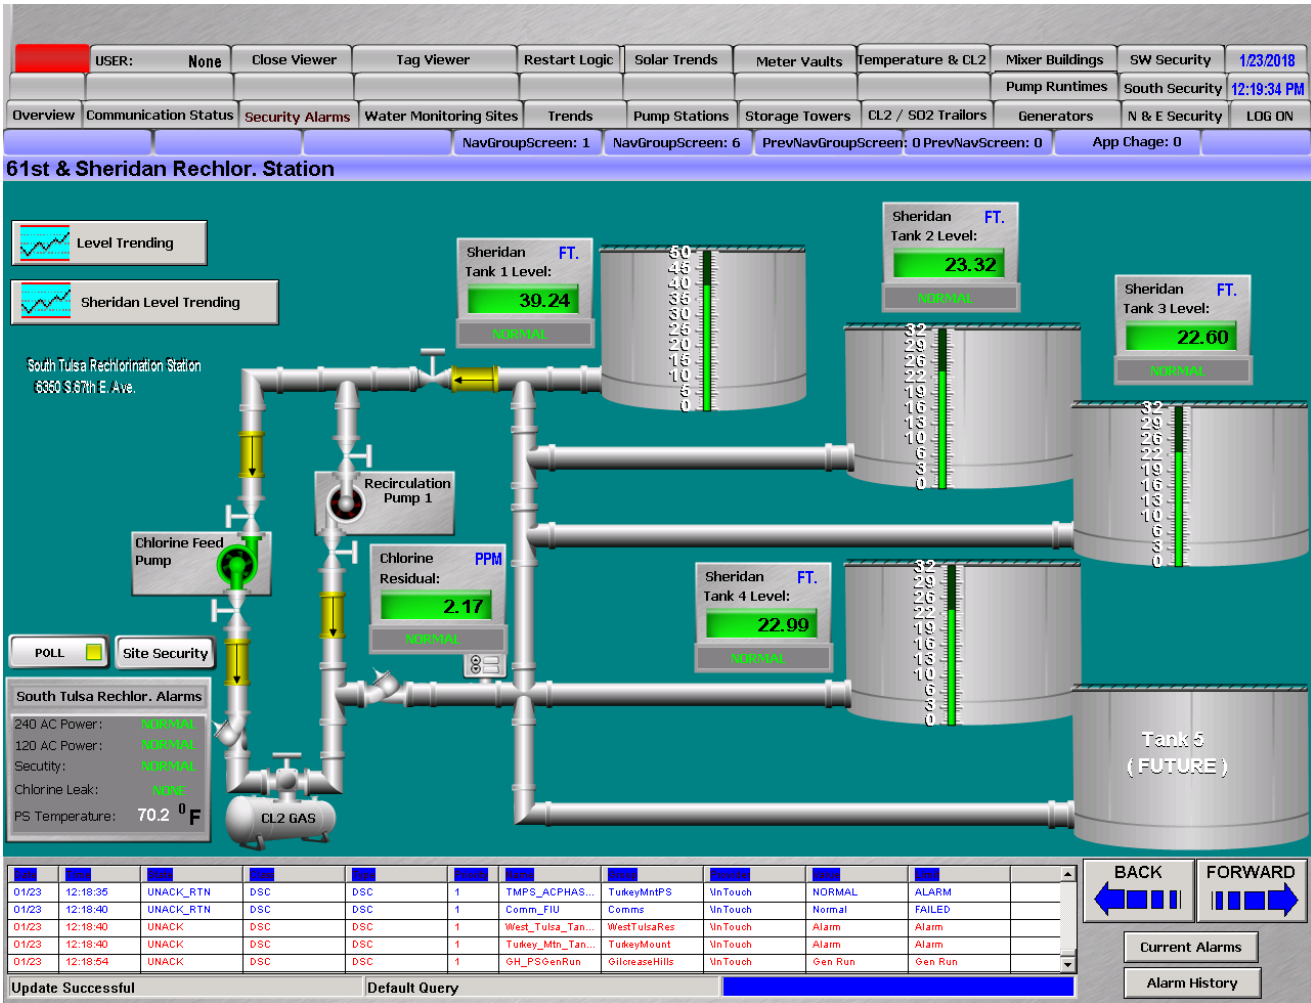

The four storage tanks located at 61st and Sheridan account for slightly greater than half of the City's available storage capacity. The treatment plants use these tanks to gauge system demand then increase, or decrease, production to meet current needs. When tank levels decrease to a certain level, the plants will increase production. When the tanks reach an upper limit level, the plants decrease production. |

Summary of Procedure

During the months of June through October, Sheridan Tank No. 4 level is to be cycled between 12 and 24 feet, over a 3-day period. This means that the level should increase from 12 feet to 24 feet within 3 days, followed by a decrease to 12 feet over the next 3 days. In order to achieve this goal an average draft rate of 4 feet per day must be achieved.

Control phase – Monitoring Sheridan tank levels

Control phase – Utilizing technology to monitor water system activity
